After reading this chapter you should be able to:

- Run a live session and use `gnome-disks` to view and change disk partitioning
- Install Fedora from a live session
- Install Fedora/RHEL using an Install Image
- Modify system behavior using boot parameters
- Modify partitions during installation
- Select software during installation
- List the requirement and considerations for a dual-boot configuration
Chapter 2 covered planning the installation of Fedora/RHEL: determining the requirements; planning the layout of the hard disk; obtaining the files you need for the installation, including how to download and burn or write Install, Live, and Network Images to installation media; and collecting information about the system. This chapter focuses on installing Fedora/RHEL. Frequently the installation is quite simple, especially if you have done a good job of planning. Sometimes you might run into a problem or have a special circumstance; this chapter gives you tools to use in these cases. Read as much of this chapter as you need to; once you have installed Fedora/RHEL, continue with Chapter 4, which covers getting started using the Fedora/RHEL desktop and command line.

**The New Anaconda Installer**

The new Anaconda installer, introduced in Fedora 18, has been totally rewritten. The Anaconda user interface changed from a linear (wizard) model to a hub-and-spoke model. Using this model means Anaconda can perform background processing (e.g., you can still be entering information while Anaconda is installing packages) and you can skip screens that are not pertinent to your installation. See fedoraproject.org/wiki/Anaconda/NewInstaller for more information.

**Chapter 17 explains how to set up a virtual system**

**tip** To install Fedora/RHEL on a virtual system, you build the virtual system and then follow the instructions in this chapter for installing the operating system. See page 663 for instructions on setting up a QEMU/KVM virtual machine and page 671 for setting up a VMware virtual machine.

**Upgrading a Fedora system**

**tip** The new Anaconda installer will not upgrade a Fedora system from one release to the next. You must use FedUp (FEDora UPgrader), which works on Fedora 17 and later. Visit the Fedora Web page at fedoraproject.org/wiki/FedUp for more information.

**Running a Fedora Live Session**

As discussed in Chapter 2, a live session is a Linux session you run on a computer without installing Linux on the computer. When you reboot after a live session, the computer is untouched. If you are running Windows, after a live session Windows boots the way it did before the live session. If you choose, you can install Fedora from a live session. RHEL does not offer a live session.

A live session gives you a chance to preview Fedora without installing it. Boot from a Live Image to begin a live session and work with Fedora as explained in Chapter 4. When you are finished, remove the installation medium and reboot the system. The system will boot as it did before you ran the live session.
Preserving files

Because a live session does not write to the hard disk (other than using a swap partition, if one is available), none of the work you save will be available once you reboot. You can use a USB flash drive, email, or another method to transfer files you want to preserve to another system. The `liveusb-creator` utility (page 50) can create persistent storage on a USB drive that you can write to from a live session.

**Booting the System**

Before Fedora can display the desktop of a live session or install itself on a hard disk, the Linux operating system must be read into memory (booted). This process can take a few minutes on older, slower systems and systems with minimal RAM.

In most cases, you can boot Fedora to run a live session that displays a desktop without doing anything after you boot from a Live Image. To begin, insert the installation medium holding a Live Image (the standard GNOME Fedora Desktop Live Media) into the system and turn on or reset the system. Refer to “BIOS setup” on page 31 if the system does not boot from the CD, DVD, or USB drive. Or refer to “Modifying Boot Parameters (Options)” on page 70 if Fedora does not boot or displays an error message.

A few moments after you start the system, Fedora displays a screen that says **Starting Fedora Live in 10 seconds. Press any key to interrupt.** and counts down from 10 (Figure 3-1). Next the system displays some messages and then a graphical outline of the Fedora logo that gets filled in as the system boots. The screen goes blank and then Fedora displays a Welcome to Fedora window. In this window you can click **Try Fedora** or **Install to Hard Drive**.
Checking the installation medium

The first time you use an installation medium, it is a good idea to check it for defects. To do so, interrupt the automatic boot by pressing the SPACE bar while Fedora is counting down. Use the DOWN ARROW key to highlight the Troubleshooting line and press RETURN (the mouse will not work yet). Fedora displays the Troubleshooting menu (Figure 3-2). Use the DOWN ARROW key to highlight Test this media & start Fedora Live; press RETURN.

Anaconda displays a line labeled Checking that shows the percent of the disk it has checked as it verifies the contents of the installation medium. If the installation medium is good, the system boots.

Memory test

Selecting Run a memory test from the Troubleshooting menu runs memtest86+, a GPL-licensed, stand-alone memory test utility for x86-based computers. Press C to configure the test; press ESCAPE to exit and reboot. See www.memtest.org for more information.

Fedora provides comprehensive installation documentation

 GNOME If you are booting from Fedora Desktop Live Media (what this book refers to as a Live Image), the system will run the GNOME desktop manager; Fedora automatically logs in as the user named liveuser and displays the Welcome to Fedora window. This window has two large buttons: Try Fedora and Install to Hard Drive. When you click Try Fedora, GNOME displays a window that explains how to install Fedora to the hard disk. Click Close and Fedora displays the GNOME desktop (Figure 3-3, page 60).

 KDE If you are booting from a Fedora KDE Live Image, the system will run the KDE desktop manager. When you boot from this disk, Fedora next displays a KDE startup screen and then the KDE desktop—there is no need to log in.
optional  Seeing What Is Going on
If you are curious and want to see what Fedora is doing as it boots from a Live Image, remove `quiet`, which controls kernel messages, and `rhgb` (Red Hat graphical boot), which controls messages from the graphical installer, from the boot parameters. See Figure 3-8 on page 70; the list of parameters on the screen will be different from those in the figure. With the Fedora Live Image Boot menu displayed (Figure 3-1) and the Start Fedora Live line highlighted, press `TAB` to display the boot command-line parameters. Use the `LEFT ARROW` key to back up over—but not remove—any words to the right of `rhgb`. Press `BACKSPACE` or `DEL` to back up over and erase `rhgb` and `quiet` from the boot command line. Press `RETURN`. Now as Fedora boots, it displays information about what it is doing. Text scrolls on the screen, although sometimes too rapidly to read. When you boot Fedora from an Install Image and when you boot RHEL, this information is displayed by default: You do not have to change the command line.

---

**INSTALLING FEDORA/RHEL**

You can install Fedora from a live session (preceding) or install Fedora/RHEL from an Install Image. Installing from a live session is simpler but does not give you the flexibility installing from an Install Image does. For example, you cannot select the language Anaconda uses, nor can you choose which software packages you will install when you install from a live session.

See what is on the hard disk (and back it up) before installing Linux

**caution** Unless you are certain the hard disk you are installing Fedora/RHEL on has nothing on it (it is a new disk) or you are sure the disk holds no information of value, it is a good idea to examine the contents of the disk before you start the installation. You can use the `gnome-disks` disk utility (page 78) from a live session for this purpose. Back up whatever is on the disk, even if it is in a partition the installation will not write to.

An Install Image holds many of the software packages Fedora/RHEL supports. You can install whichever package groups you like from an Install Image without connecting to the Internet. However, without an Internet connection, you will not be able to update the software once the system is installed.

A Live Image holds a limited set of software packages. Once you install from a Live Image, you must connect to the Internet to update the software on the system and to download and install additional packages.

To begin most installations, insert the medium holding a Live or an Install Image into the system and turn on or reset the system. For hard disk and network-based installations, you can use an Install or a Network Image.

Refer to “BIOS setup” on page 31 if the system does not boot from the installation medium.
Chapter 3  Step-by-Step Installation

Installing from a Live Session (Fedora)

Bring up a live GNOME session as explained on page 56. GNOME will display a GNOME 3 desktop that has the word Activities in the upper-left corner of the screen.

The Anaconda installer does not modify the live environment

tip The changes you make as you install Fedora from a live session do not affect the live session. For example, when you set up networking for the system you are installing, the network connection for the live environment does not change.

From a GNOME 3 desktop, click Activities; GNOME displays icons along the left side of the screen and a text box with the words Type to search in it (Figure 3-3). Near the bottom of the icons is an icon depicting a hard drive with a green tick on top of it. Left-click this icon when you want to install Fedora. Continue reading at “Using Anaconda” on page 63.

Installing from an Install Image

To install Fedora/RHEL from an Install Image, insert the installation medium and turn on or reset the system. After a few moments, the system displays the Fedora/RHEL Boot menu (Figure 3-4) and a message that says Automatic boot in 60 seconds. Refer to “BIOS setup” on page 31 if the system does not boot from the installation medium. Refer to “Modifying Boot Parameters (Options)” on page 70 if Fedora/RHEL does not boot or displays an error message.
Press the \texttt{SPACE} bar within 60 seconds to stop the countdown. If you do not press the \texttt{SPACE} bar, after 60 seconds Fedora/RHEL begins a graphical installation.

The Fedora Install Image Boot menu has the following selections:

- **Install Fedora**: Installs a Fedora/RHEL system using the Anaconda graphical installer.
- **Test this media & install Fedora**: Tests the installation medium and installs a Fedora/RHEL system using the Anaconda graphical installer.
- **Troubleshooting**: Displays the Troubleshooting menu (Figure 3-5).

![Figure 3-4](image)

**Figure 3-4** The Install Image Boot menu

![Figure 3-5](image)

**Figure 3-5** The Install Image Troubleshooting menu
The Troubleshooting menu has the following selections.

- **Install Fedora in basic graphics mode**
  Installs a graphical Fedora/RHEL system using the graphical installer. Anaconda does not attempt to determine the type of display attached to the system; it uses a basic video driver that works with most displays. Choose this selection if the installation fails before Anaconda displays the Welcome to Fedora screen (page 63).

- **Rescue a Fedora system**
  Brings up a minimal Fedora/RHEL system but does not install it. After detecting the system’s disks and partitions, the system enters single-user/rescue mode and allows you to mount an existing Linux filesystem. For more information refer to “Rescue an Installed System” on page 456.

- **Run a memory test**
  Runs the memory test described on page 58.

- **Boot from local drive**
  Boots the system from the hard disk. This selection frequently has the same effect as booting the system without the installation medium in place (depending on how the BIOS [page 31] is set up).

- **Return to main menu**
  Displays the Fedora Install Image Boot menu.

### The Anaconda Installer

Anaconda, which is written in Python and C, identifies the hardware, loads drivers, probes for the devices it will use during installation, builds the filesystems, starts the X server, and installs the Fedora/RHEL operating system. Anaconda can run in graphical interactive mode (default), limited textual mode (see the text on page 72), or automated mode (see “Editing a Kickstart Script” on page 83).

Exactly which screens Anaconda displays depends on whether you are installing Fedora from a live session, an Install Image, or a Network Image; whether you are installing RHEL; which paths you pick through the installation process; and which parameters you specify on the boot command line. Unless you tell it not to, Anaconda probes the video card and monitor, and starts a native X server.

While it is running, Anaconda opens the virtual consoles (page 121) shown in Table 3-1. You can display a virtual console by pressing **CONTROL-ALT-x**, where x is the virtual console number and x is the function key that corresponds to the virtual console number.

**Table 3-1 Virtual console assignments during installation**

<table>
<thead>
<tr>
<th>Virtual console</th>
<th>Install Image</th>
<th>Live Image</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Installation dialog</td>
<td>GUI interactive installation</td>
</tr>
<tr>
<td>2</td>
<td>Shell</td>
<td>Login prompt (log in as <strong>liveuser</strong>)</td>
</tr>
<tr>
<td>3</td>
<td>Installation log</td>
<td>Installation log</td>
</tr>
<tr>
<td>4</td>
<td>Storage log</td>
<td>Login prompt (log in as <strong>liveuser</strong>)</td>
</tr>
<tr>
<td>5</td>
<td>Program log</td>
<td>Program log</td>
</tr>
</tbody>
</table>
At any time during the installation, you can switch to virtual console 2 (by pressing \texttt{CONTROL-ALT-F2}) and give commands to see what is going on. Do not give any commands that change any part of the installation process. To switch back to the graphical installation screen, press \texttt{CONTROL-ALT-F1} (Live Image) or \texttt{CONTROL-ALT-F7} (Install Image).

**Testing the Installation Medium**

The first time you use an installation medium, select \texttt{Test this media \& install Fedora} from the Boot menu and press \texttt{RETURN} to boot the system. Fedora displays a few lines before displaying a line that starts with \texttt{Checking}. This line shows the percent of the disk Anaconda has checked as it verifies the contents of the installation medium. If the installation medium is good, the system boots. If you use the same medium again, you do not have to test it: Select \texttt{Install Fedora}.

A DVD might fail the media test if the software that was used to burn the disk did not include padding. If a DVD fails the media test, try booting using the \texttt{nodma} parameter. See page 70 for information on adding parameters to the boot command line. If the DVD passes the media test when you boot the system using the \texttt{nodma} parameter, the DVD is good; reboot the system without this parameter before installing Fedora/RHEL. If you install Linux after having booted using this parameter, the kernel will be set up to always use this parameter. As a consequence, the installation and operation of the system can be slow.

**Using Anaconda**

Anaconda displays the Welcome to Fedora screen after it obtains enough information to start the X Window System. Scroll and click to highlight the language you want to use for installation. This language is not necessarily the same language the installed system will display. Click \texttt{Continue}. Anaconda displays the Installation Summary screen.

**The Installation Summary Screen**

Anaconda takes a while to load the information the Installation Summary screen displays (Figure 3-6, next page). While it is loading, some items are grayed out. You must wait until Anaconda finishes loading this information and the items are no longer grayed out before you can select these items. You might need to scroll down to display the Storage item.

Typically an orange bar that holds an exclamation point in a triangle and the words \texttt{Please complete items marked with this icon before continuing to the next step} appears at the bottom of the window. While this bar is displayed the button labeled \texttt{Begin Installation} is grayed out to indicate it will not work. The only items you must
Chapter 3 Step-by-Step Installation

open and modify are those that display this icon. The items displayed when you are installing Fedora from a live session are a subset of those displayed when you install from an Install Image.

Click on an item to display a screen that allows you to work with that item. Click Done to return to the Installation Summary screen. The items that appear in the Installation Summary screen are divided into three groups: Localization, Software (not from a live installation), and Storage.

You do not need to open most items on the Installation Summary screen
tip Each item on the Installation Summary screen displays a note about what Anaconda has chosen for that item. You do not need to open an item if it is set properly. For example, if the Date & Time item shows America/Los_Angeles timezone and that is correct, you do not need to open this item. Frequently the only item you need to open is Installation Destination (page 67).

LOCALIZATION

Date & Time The Date & Time screen displays a world map that allows you to specify the local time zone. Click a city in the local time zone; Anaconda displays the name of the city in the spin box labeled City. Alternately, you can use the spin boxes labeled Region and City to specify a city.

By default, Anaconda sets up the new system to use NTP (Network Time Protocol) to keep the system clock accurate. If you do not want to use NTP, click the switch labeled Network Time to set it to Off and use the widgets at the bottom of the screen to set the system clock.

Keyboard The Keyboard Layout screen allows you to specify the type of keyboard that will be attached to the installed system. The box on the left side of this screen displays available keyboard layouts. The entry at the top of the list is the default layout to be used
both during installation and for the installed system. Use the buttons at the bottom of this box to add layouts and remove, move, and test the highlighted layout.

You can specify a keyboard for use during installation only, but you can specify only keyboards that are in the list on the Keyboard Layout screen. Use the small keyboard button to make this change. The button is located at the upper-right of all installation screens.

Language Support
Not available with a live installation. In the Language Support screen, put ticks in the check boxes adjacent to the languages you want to install.

SOFTWARE
Not available with a live installation.

Installation Source
Typically you install Fedora from the medium you booted from. If that is the case you do not need to open the Installation Source screen. This screen allows you to

- Specify as the installation source either the medium you booted from (Auto-detected installation media) or a location (URL) on the network
- Choose to verify the medium you booted from
- Install updates as Anaconda installs the system
- Specify additional repositories (page 533) to use during installation.

The top part of the Installation Source screen is labeled Which installation source would you like to use? and has two radio buttons. By default, Auto-detected installation media is selected and displays the name of the device that holds and the label on the medium. Click the button labeled Verify to test that the image on the installation medium is good.

Test the installation medium
It is possible for data to become corrupted while fetching an installation image; it is also possible for a transient error to occur while writing an image to a recordable medium. When you boot from an installation medium, the button labeled Verify on the Installation Source screen allows you to verify that the image on the installation medium does not contain any errors. Testing the installation medium takes a few minutes but can save you hours of aggravation if the installation fails due to a bad medium.

The second radio button in this section is labeled On the network and allows you to specify a Web, FTP, or NFS URL. When you select Closest mirror from the drop-down list, Anaconda finds the closest Fedora mirror and downloads packages from that site; after you click Done, Anaconda takes a moment to locate the closest mirror. If you reopen the Installation Source screen after selecting Closest mirror, Anaconda reverts to the installation medium and not installing updates.

By default Anaconda does not install updates while it installs Fedora/RHEL: You update the software after you install the system. Remove the tick from the check box labeled Don’t install the latest available software updates to cause Anaconda to update software as it installs it.
Chapter 3  Step-by-Step Installation

The bottom portion of the screen allows you to specify additional repositories (page 542) that Anaconda can use during installation.

If the local system is connected to a network that runs a DHCP server (page 491), Anaconda configures the network automatically and you do not have to open the Network Configuration screen. This screen

- Displays information about the network interface and connection Anaconda is using
- Allows you to turn off the network connection
- Allows you to (re)configure the network
- Allows you to specify a hostname for the installed system

When you click the button labeled Configure, Anaconda displays a window that allows you to modify the network connection.

Enter the hostname of the installed system in the text box labeled Hostname at the bottom of the screen.

The Software Selection screen (Figure 3-7) allows you to select which environmental package group and add-on package groups you want to install. An installation from a Network Image allows you to select from more package groups than does installation from an Install Image. By default, Anaconda installs the GNOME desktop and the LibreOffice productivity suite.

The left side of the Software Selection screen is labeled Base Environment and allows you to specify an environmental package group that specifies a desktop environment (e.g., GNOME, KDE, LXDE) or a system function (e.g., Web server, Infrastructure Server). You can make only one selection from this column. All the desktops install appropriate networking software and the Firefox Web browser. The Basic Desktop

![Figure 3-7  The Software Selection screen](image)
selection allows you to specify more than one desktop on the right side of the screen. The Minimal Install selection installs as few software packages as possible for a text- 
tual system (no GUI). The right side of the screen allows you to select package groups that are typically used with the base environment you selected on the left. (Fedora; RHEL selections differ slightly).

**Use a Minimal Install for older, slower hardware**

*tip* The last entry in the Base Environment column is Minimal Install. Select this entry for older, slower hardware. This selection installs a system that has no GUI, just a command-line (textual) interface. If the system does not have enough memory to perform a graphical installation, perform a textual installation using the text boot parameter (page 72) and VNC (page 72) or Kickstart (pages 71 and 83).

**You can select only package groups, not individual packages**

*tip* To streamline the installation process, the new Anaconda allows you to specify which package groups you want to install but not which packages. You must add or remove individual packages after the installation is complete. Visit ohjeezlinux.wordpress.com/2013/02/07/anaconda-packaging-retrospective for background information. Use Kickstart (pages 71 and 83) if you require more granular control over package selection.

**STORAGE**

You might need to scroll down to display the Installation Destination selection. At a minimum, Anaconda requires you to confirm where you want to install Fedora/RHEL, although this screen gives you many more choices.

By default, with a single empty disk, Anaconda installs Fedora/RHEL on the whole disk. If the disk is not empty and there is enough free space (page 36) on the disk, Anaconda installs Fedora/RHEL in the free space.

If this default is acceptable, open the Installation Destination screen; a tick will appear over the single disk (similar to Figure 3-9 on page 73). Click **Done**; Anaconda displays the Installation Options dialog. This dialog allows you to choose whether you want to review and/or modify the default disk setup or whether you want to continue without reviewing it. The bottom of the screen has a check box that allows you to encrypt the data on the disk (page 30). For the simplest installation, do not make any change; click **Continue**.

If there is not enough free space to install Fedora/RHEL, if the computer has more than one hard disk, if you want to reclaim disk space from an exiting partition, or if you want to customize the disk partitions, see “Advanced Disk Configuration” on page 72.

**BEGIN COPYING FILES**

After making the changes you want (and those that Anaconda requires) to the Installation Summary items, click the button labeled **Begin Installation**. While it is installing Fedora/RHEL, Anaconda places a Kickstart file (page 83) that corresponds to your selections in `/root/anaconda-ks.cfg`.

Installing Fedora/RHEL can take a while. The amount of time depends on the hardware you are installing the operating system on and the number of software packages you are installing.
Objectives

After reading this chapter you should be able to:

- Log in on the Fedora desktop
- Understand root privileges
- Change the desktop background
- Use the Nautilus File Manager to work with files
- Correct mistakes on a command line
- Explain what you can do using a window titlebar
- Update and install software
- Find documentation using man, info, and yelp
- Open a terminal emulator and run programs from the command line
- Create and run a simple shell script
Chapter 4  Introduction to Fedora and Red Hat Enterprise Linux

One way or another you are sitting in front of a computer that is running Fedora or RHEL (Red Hat Enterprise Linux). After describing the conventions this book uses and root (Superuser) privileges, this chapter takes you on a tour of the system to give you some ideas about what you can do with it. The tour does not go into depth about choices, options, menus, and so on; that is left for you to experiment with and to explore in greater detail throughout later chapters of this book.

The tour covers how to log in on the system, the GNOME 3 Standard and Classic desktops, working with the desktop, the Nautilus File Manager, the Settings window, getting help, and installing software. The final part of the chapter introduces some command-line utilities and describes how to work from the command line, concluding with a section on solving problems logging in and password security.

Be sure to read the warning about the dangers of misusing the powers of root (Superuser) in the next section. While heeding that warning, feel free to experiment with the system: Give commands, create files, click objects, choose items from menus, follow the examples in this book, and have fun.

**Curbing Your Power (Superuser/root Privileges)**

While you are logged in as the user named root, you are referred to as Superuser or administrator; you are working with root privileges and have extraordinary systemwide powers. Running the su or sudo utility can give you similar privileges. When working with root privileges, you can read from or write to almost any file on the system, execute programs that ordinary users cannot, and more. On a multiuser system you might not be able to run certain programs. Nevertheless, someone—the system administrator—knows the root password or is a member of the administrative group named wheel, and that person maintains the system. When you are running Linux on your own computer, you will assign a password to root when you install Linux. Refer to “Running Commands with root Privileges” on page 422 for more information.

**Do not experiment while you are working with root privileges**

Feel free to experiment when you are not working with root privileges. When you are working with root privileges, do only what you have to do and make sure you know exactly what you are doing. After you have completed the task at hand, revert to working as yourself. When working with root privileges, you can damage the system to such an extent that you will need to reinstall Linux to get it working again.

**Logging In on the System**

When you boot a default Fedora/RHEL system, gdm (GNOME display manager) displays a Login screen (Figure 4-1) on the system console. In the middle of the screen is a list of names of users who can log in on the system. At the upper-right are icons that allow you to restart or shut down the system, adjust the volume, and display the
universal access menu that allows you to change accessibility preferences (e.g., make the text larger or display a high-contrast desktop).

To log in, click your name; gdm displays the Password screen. Enter your password and press \textsc{RETURN}. If gdm displays an error message, try clicking your name and entering your password again. Make sure the \textsc{Caps Lock} key is not on (gdm displays a message if it is) because the routine that verifies your entry is case sensitive. See page 135 if you need help with logging in and page 112 if you want to change your password. The system takes a moment to set things up and then displays a workspace.

**Figure 4-1** The GNOME Login screen

The GNOME 3 Standard and Classic Desktops

Fedora 15 introduced GNOME 3 and the GNOME shell. GNOME 3 can run in standard mode (Standard desktop) or classic mode (Classic desktop). The GNOME 3 Standard desktop is radically different from the GNOME 2 desktop, following the trend toward simpler, more graphical desktops that have more icons and fewer menus. All versions of Fedora from 15 onward run the GNOME 3 Standard desktop by default. Figure 4-2 on page 93 and Figure 4-3 on page 94 show commonly used screens on a GNOME 3 Standard desktop. See the next section for more information.

By default, RHEL 7 runs the GNOME 3 Classic desktop, a group of GNOME Shell extensions that give GNOME 3 a GNOME 2 look and feel, including the Applications and Places menus. Figure 4-5 on page 97 shows the GNOME Classic desktop. For more information refer to “The GNOME Classic Desktop” on page 96.

This book uses the Linux textual interface (CLI) for most tasks, including setting up servers and programming in \texttt{bash}, SQL, and Python. Where this book describes a GUI utility, it explains how to open the utility/window by pressing \texttt{ALT-F2} to display the Enter a Command window and typing the name of the utility. Alternately, you can press the \texttt{SUPER} (Windows) key to display the Search text box and enter the name
of utility there. These techniques work from both the GNOME 3 Standard desktop (Fedora) and Classic desktop (RHEL). For more information refer to “The Search Text Box and the Enter a Command Window” on page 98.

**You can run the Classic desktop on Fedora**

You can use `gnome-tweak-tool` (gnome-tweak-tool package) to change many aspects of how GNOME windows look and work. Visit wiki.gnome.org/GnomeTweakTool for more information.

**The GNOME 3 Standard Desktop (Fedora)**

This section briefly describes how to use the GNOME 3 Standard desktop that Fedora installs by default. For more information visit wiki.gnome.org/GnomeShell/CheatSheet. The extensions.gnome.org Web site lists extensions to GNOME 3. See “The GNOME Classic Desktop” on page 96 if you are running RHEL.

When you log in on a system running GNOME 3 the workspace is empty. On the Top panel (the bar at the top of the workspace) are objects: the word Activities, a clock, speaker and networking icons, and your name (or Live System User). You can click one of these objects to work with it. The Top panel remains constant as the information displayed below it changes.

**The Activities Overview Screen**

Click Activities at the top left of a workspace (or press the **SUPER** [Windows] key) to display the Activities Overview screen (Figure 4-2). This screen holds the Search text box (near the top), icons of favorite applications (on the left), and a section holding shrunken views of workspaces (on the right); each of these views contain live thumbnails of running applications. When only one workspace exists, you need to move the cursor to the right side of the screen to display this section. Shrunken views of the windows in the active workspace appear in the center of the screen. If the active workspace is empty, the center of the screen is blank.

Figure 4-2 shows an Activities Overview screen in which the active workspace holds windows that are running Firefox and Files (Nautilus; page 102). Because the shrunken Firefox window is selected (highlighted), it has an X in a circle at its upper-right corner. Click this X to close the window and terminate Firefox. Click the Firefox or Files window to close the Activities Overview screen and display the active workspace with the window you clicked in the foreground.
Making a workspace active

Still looking at Figure 4-2, you can also click one of the shrunken workspaces along the right side of the screen to make that workspace active. Click the empty workspace at the bottom of the stack to open a new, empty workspace.

Running an application from the Favorites list

There are several ways to start an application. If the icon of the application you want to run is in the Favorites list, click that icon; GNOME closes the Activities Overview screen and opens in the active workspace the application whose icon you clicked.

Running an application from the Search text box (SUPER key)

You can also type the name of the (graphical) application (e.g., gnome-terminal or gnome-disks) or the name of the window the application displays (e.g., Terminal or Disks) in the Search text box, and press RETURN to open that application in the active workspace. If the Search text box is not visible, press the SUPER (Windows) key to display it.

Running an application from the Enter a Command window (ALT-F2 key)

Finally, you can press ALT-F2 to display the Enter a Command window, type the name of the application or utility you want to run, and press RETURN to run an application. You must run a textual application from a terminal emulator such as gnome-terminal (which you can start from an Enter a Command window). See page 98 for more information.

The Applications Overview Screen

At the bottom of the list of favorite application icons on the left of the Activities Overview screen is the Show Applications icon (it holds nine small squares; see Figure 4-2).
Click this icon to display the Applications Overview screen (Figure 4-3). This screen displays application icons. Clicking the button labeled Frequent at the bottom of the screen displays only icons of applications you use frequently. Clicking All displays a scrollable list of application icons. Not all applications, or utilities, have icons; use the Enter a Command window (page 98) to run applications that do not have icons.

Left-click an icon to close the Applications Overview screen and open the associated application in the active workspace. Right-click an icon to display a context menu that can include Add to Favorites (if the icon is not in the list of favorites), Remove from Favorites (if it is already in the list of favorites), New Window (closes the Applications Overview screen and opens the application in a new window in the active workspace even if it is already opened), and a line that identifies an already open instance of the application (closes the Applications Overview screen and opens the application in the workspace in which it is already running).

**THE APPLICATION SWITCHER: CHANGING THE INPUT FOCUS**

The window with the input focus is the one that receives keyboard characters and commands you type. In addition to using the Activities Overview screen, you can change which window has the input focus using the keyboard; this process is called window cycling.

When you press ALT-TAB when the desktop is displayed, GNOME displays in the center of the workspace the Application Switcher, a box that holds icons representing the programs running in the windows on the desktop. It also shifts the input focus to the window that was active just before the currently active window, making it easy to switch back and forth between two windows. When you hold ALT and press TAB multiple times, the focus moves from window to window. Holding ALT and SHIFT and repeatedly pressing TAB cycles in the other direction.
INSTALLING THE CLASSIC DESKTOP ON GNOME 3 (FEDORA)

The following instructions explain how to install and run the Classic desktop under Fedora. RHEL 7 runs the Classic desktop by default.

1. With GNOME running the GNOME 3 Standard desktop, click the word Activities at the upper left of the screen. Type `terminal` and press RETURN; GNOME displays a terminal emulator.

2. With the cursor over the terminal emulator, type the following command; terminate the command using a RETURN.

   ```
   $ su -c 'yum -y install gnome-classic-session'
   Password: ...
   Complete!
   ```

   The `su` utility will prompt for the `root` password. Once you enter the `root` password and press RETURN, `yum` will display a lot of information as it installs the `gnome-classic-session` package. When `yum` displays Complete! and the shell displays its prompt (`$`), the package is installed. For more information on using `yum` to install packages see page 534.

3. From a live session only (or if Log Out does not appear in the menu described in the next step), give the following additional commands from the terminal emulator. Substitute your name for `sam` in the first two commands and supply the `root` password when you are prompted.

   ```
   $ su -c 'useradd sam'
   $ su -c 'passwd sam'
   Changing password for user sam.
   New password: 
   Retype new password: 
   passwd: all authentication tokens updated successfully.
   $ su -c 'systemctl restart gdm'
   ```

   After a few moments GNOME logs you in as Live System User again (or allows you to log in as yourself).

4. Log off by clicking your name or Live System User at the upper right of the screen, clicking Log Out from the menu GNOME displays, and then clicking the button labeled Log Out from the small window GNOME displays. (If Log Out does not appear in the menu, follow the previous step and then repeat this step.) After a few moments GNOME displays a Login screen (Figure 4-1, page 91).

5. Click your name (not Live System User) on the Login screen; GNOME displays the Password screen (Figure 4-4, next page). Just below the text box labeled Password is a small triangle followed by the word Session. Click the
Chapter 4  Introduction to Fedora and Red Hat Enterprise Linux

triangles to display the Session menu. Click GNOME Classic; GNOME moves the white dot to the entry you just clicked.

6. Type your password in the text box labeled Password and click Sign In.

After a few moments GNOME displays a Classic desktop (Figure 4-5). If you followed step 3 to add a user, gnome-initial-setup will take you through setting up that user; see page 68.

Once you have selected GNOME Classic when you log in, it is your default desktop; you do not have to select it next time you log in.

The GNOME Classic Desktop (RHEL and Optionally Fedora)

This section briefly describes how to use the GNOME Classic desktop that is installed by default on RHEL. Refer to “The GNOME 3 Standard Desktop” on page 92 if you are running Fedora. If you want to install and run a Classic desktop under Fedora refer to “Installing the Classic Desktop on GNOME 3” on the previous page.

Panels and objects

When you log in, the GNOME Classic desktop displays a workspace that includes the Top and Bottom panels (bars) that help you get your work done easily and efficiently (Figure 4-5). Each of the panels can hold several icons and words called objects.

The Applications menu

You can run an application from the Applications menu that appears at the left end of the Top panel (Figure 4-5). Click Applications to display the Applications menu. When you move the mouse pointer over one of the selections in this menu and leave it there for a moment (this action is called hovering), the menu displays a submenu. Move the cursor to and click one of the items in the submenu to select and run it.
The Places menu has no submenus; click an entry in this menu to select it. The Places menu on the GNOME Classic desktop is the same as Places in the Nautilus File Browser Sidebar; see page 103 for more information.

**Working with the Desktop**

This section discusses several ways you can work with the desktop. It applies to both the GNOME 3 Standard and Classic desktops.

**Terminology**

In addition to this section, see the Glossary, which defines data entry widgets (page 1281) such as the combo box (page 1243), drop-down list (page 1248), list box (page 1258), and text box (page 1277).

**Workspace** A workspace is a screen that holds windows of one or more applications. The Activities Overview screen (page 92) and the Application Switcher (page 94) enable you to display any of the running applications and its workspace.

**Active workspace** The active workspace is the workspace that displays the windows you can work with immediately. Only one workspace can be active at a time.

**Desktop** The desktop, which is not displayed all at once, is the collection of all workspaces.
Panels are bars that can appear on the desktop and hold objects. The Top panel appears at the top of the screen and the Bottom panel, if it is present, appears at the bottom of the screen.

Object An object is a word, icon, or menu that you can select by clicking.

**Click and right-click**

**tip** This book uses the term *click* when you need to click the *left* mouse button. It uses the term *right-click* when you need to click the *right* mouse button. See page 110 for instructions on adapting the mouse for left-handed use.

### The Search Text Box and the Enter a Command Window

You can start a graphical application (open a window) by pressing the **SUPER** (Windows) key to display the Search text box (Figure 4-2, page 93) or by pressing `ALT-F2` to display the Enter a Command window (Figure 4-6) and typing the name of the application. Try typing `firefox` and pressing **RETURN** to start Firefox. The new window opens on the active workspace.

**You must run a textual application (utility) from a terminal emulator**

**tip** A textual application or utility requires a textual environment such as a terminal emulator to run. The Search text box and Enter a Command window do not provide a textual environment and so cannot run a textual application. However, you can run gnome-terminal, a graphical application that provides a textual environment using either of these methods. You can then run the textual application from the terminal emulator that gnome-terminal displays.

### Application Menus

Many applications have an Application menu that allows you to set preferences and get help with the application. While the application is active (has the focus), click the object (the name of the window) for the application on the Top panel; GNOME
Working with the Desktop 99

opens the Application menu for the application. Figure 4-7 shows the Application
menu for the Software (gpk-application) application. See “Updating, Installing, and
Removing Software Packages” on page 116 for more information on this
application.

Figure 4-7  The Software (gpk-application) Application menu

CONTEXT MENUS

A context menu has choices that apply specifically to the window or object you
click. The choices differ from window to window and from object to object.
Some windows do not have context menus. Frequently a right-click displays a
context menu.

Right-click to display a context menu

tip Right-click an object to display its context menu. Each object displays its own context menu, although similar objects have similar context menus. Most context menus have either a Preferences or Properties selection.
Chapter 4 Introduction to Fedora and Red Hat Enterprise Linux

Windows

In a workspace, a window is a region that runs, or is controlled by, a particular program.

Titlebar

A titlebar (Figure 4-8) appears at the top of most windows and controls the window it is attached to. You can double-click the titlebar to maximize and restore a window. Some windows can be restored only by pressing SUPER-DOWN ARROW (SUPER is the Windows key) or by dragging down from an empty spot on the Top panel. Clicking the close button (X) closes the window and usually terminates the program running in it. To reposition the window, left-click the titlebar and drag the window to the desired location.

Window Operations menu

The Window Operations menu contains operations you can perform on any window. Right-click the titlebar to display this menu. This menu allows you to minimize, maximize, resize, or close a window; move the window within the workspace; move a window to another workspace; keep the window on top of or below other windows; and cause the window to always be visible on the displayed workspace. It also shows the keyboard shortcuts for some of these actions. SUPER refers to the Windows key (e.g., SUPER+Up means hold the Windows key down and press the UP ARROW key).

Menubar

The menubar (Figure 4-8) holds icons you can use to work with the window contents.

Toolbar

A toolbar (Figure 4-8) usually appears near the top of a window and contains icons, text, applets, menus, and more. Many kinds of toolbars exist. The titlebar is not a toolbar.

Figure 4-8  A typical window
Resizing a window
To resize a window, position the mouse pointer over an edge of the window; the pointer turns into an arrow pointing to a line. When the pointer is an arrow pointing to a line, you can click and drag the side of a window. When you position the mouse pointer over a corner of the window, you can resize both the height and the width of the window simultaneously. Some windows are not resizeable and some windows do not allow you to resize them from all four sides.

Moving a window
To move a window, click and drag the titlebar. Dragging a window to the top of the screen maximizes the window.

Cutting and Pasting Objects Using the Clipboard

There are two similar ways to cut/copy and paste objects and text both within and between windows. In the first method, you use the clipboard, technically called the copy buffer, to copy or move objects or text. To do so, you explicitly copy an object or text to the buffer and then paste it somewhere else. Applications that follow the user interface guidelines use CONTROL-X to cut, CONTROL-C to copy, and CONTROL-V to paste. Application context menus frequently provide these options.

You might not be familiar with the second method to copy and paste text—using the selection or primary buffer, which always contains the text you most recently selected (highlighted). You cannot use this method to copy objects. Clicking the middle mouse button (click the scroll wheel on a mouse that has one) pastes the contents of the selection buffer at the location of the mouse pointer. If you are using a two-button mouse, click both buttons at the same time to simulate clicking the middle button.

With both of these techniques, start by highlighting an object or text to select it. You can drag a box around multiple objects to select them or drag the mouse pointer over text to select it. Double-click to select a word or triple-click to select a line or a paragraph.

Next, to use the clipboard, explicitly copy (CONTROL-C) or cut (CONTROL-X) the objects or text. If you want to use the selection buffer, skip this step.

To paste the selected objects or text, position the mouse pointer where you want to put it and then either press CONTROL-V (clipboard method) or press the middle mouse button (selection buffer method).

Use SHIFT-CONTROL-C and SHIFT-CONTROL-V within a terminal emulator

The CONTROL-C, CONTROL-X, and CONTROL-V characters do not work in a terminal emulator window because the shell running in the window intercepts them before the terminal emulator can receive them. However, you can use SHIFT-CONTROL-C and SHIFT-CONTROL-V in place of CONTROL-C and CONTROL-V, respectively. There is no keyboard shortcut for CONTROL-X. You can also use the selection buffer in this environment or use copy/paste from the Edit selection on the menubar or from the context (right-click) menu.
When using the clipboard, you can give as many commands as you like between the `CONTROL-C` or `CONTROL-X` and `CONTROL-V`, as long as you do not press `CONTROL-C` or `CONTROL-X` again. When using the selection buffer, you can give other commands after selecting text and before pasting it, as long as you do not select (highlight) other text.

**LOGGING OFF**

Log off by clicking your name or Live System User at the upper-right corner of the screen, click Log Out from the menu GNOME displays, and then click the button labeled Log Out from the small window GNOME displays. Select Power Off to shut down or restart the system, among other options. Alternately, you can give the command `gnome-session-quit` from an Enter a Command window (`ALT-F2`) or a terminal emulator.

**USING THE NAUTILUS FILE MANAGER**

Nautilus (the Files program) is the simple, powerful GNOME file manager. You can use it to create, open, view, move, and copy files and folders as well as to execute applications and scripts.

**Terms: folder and directory**

Nautilus displays the File Browser window, which displays the contents of a folder. The terms folder and directory are synonymous; “folder” is frequently used in graphical contexts, whereas “directory” might be used in textual or command-line contexts. This book uses these terms interchangeably.

**Term: File Browser**

This book sometimes uses the terms File Browser window and File Browser when referring to the Nautilus File Browser window.

**Opening Nautilus**

Give the command `nautilus` from an Enter a Command window (`ALT-F2`) or a terminal emulator to open a Nautilus File Browser window that shows the files in your home directory (Figure 4-9). From a GNOME 3 desktop you can type `nautilus` or `files` in the Search text box in the Activities Overview screen (page 92). Alternately, you can click the filing cabinet icon in the Applications Overview screen (page 93). From a Classic desktop you can select Home from the Places menu.

**THE NAUTILUS FILE BROWSER WINDOW**

The right side of a File Browser window shows the View pane that holds file objects; the left side shows the Sidebar that holds the Places, Devices, and Network lists.

**Application menu**

With a File Browser window active, click Files on the Top panel to display the Files Application menu. This menu allows you to set preferences for, open a location bar in, and close the File Browser window.

**View pane**

The View pane displays file icons or a list of filenames. Select the view you prefer by clicking the dots or lines button near the right end of the toolbar.

**Sidebar**

The Sidebar allows you to work with Nautilus in different ways. Close or display the Sidebar by pressing `F9`. To change the horizontal size of the Sidebar, drag the handle (Figure 4-9) on its right side. See “The Sidebar” on the next page for more information.

**Toolbar**

The left end of the toolbar allows you to display different directories in the View pane. Select Application menu⇒Enter Location to open a location bar in which you
Using the Nautilus File Manager

can enter a pathname. The right end of the toolbar holds icons that allow you to search for files, control the type of display Nautilus presents in the View pane, and display view options and location options.

**The Sidebar**

The Places section of the Sidebar holds objects that you click to change what Nautilus displays in the View pane. The Home, Documents, and Downloads objects display your directories with corresponding names. The Computer object displays the local filesystem. The Browse Network object displays systems and files on the local network. The Connect to Server object opens a window that allows you to enter a URL to connect to an SSH, FTP, or other type of server.

Trash

Selecting *Move to Trash* from an object’s context (right-click) menu moves the object to the Trash directory. Because files in the trash take up space on the hard disk (just as all files do), it is a good idea to remove them periodically. To display the Trash directory, double-click the Trash icon in the Sidebar.

**Emptying the trash**

Select *Empty Trash* from the Trash icon context (right-click) menu to permanently remove all files from the trash. (This selection is grayed out if there are no files in the trash.) Alternately, you can right-click an object in the Trash File Browser window and select *Delete* to remove only that object (file), or you can select *Restore* to move the file back to its original location. You can drag and drop files to and from the trash just as you can with any folder.

Deleting files

You can delete files without first sending them to the trash. Add *Delete* to the context menu by selecting Preferences from the Files Application menu, then selecting the Behavior tab, and putting a tick in the check box labeled Include a Delete command that bypasses Trash.
Objectives

After reading this chapter you should be able to:

- Use basic utilities to list files and display text files
- Copy, move, and remove files
- Display the beginning or end of a file
- Search, sort, print, categorize, and compare text files
- Compress, decompress, and archive files
- Count the number of letters, words, and lines in a file
- Locate utilities on the system
- Change the modification time of a file
- Display information about users and the system
- Record a session in a file
- Edit text files
Chapter 7

When Linus Torvalds introduced Linux and for a long time thereafter, Linux did not have a GUI (graphical user interface): It ran on character-based terminals only, using a CLI (command-line interface), also referred to as a textual interface. All the tools ran from a command line. Today the Linux GUI is important, but many people—especially system administrators—run many command-line utilities. Command-line utilities are often faster, more powerful, or more complete than their GUI counterparts. Sometimes there is no GUI counterpart to a textual utility; some people just prefer the hands-on feeling of the command line. This chapter describes a number of frequently used utilities and concludes with tutorials on the vim and nano text editors. See “Working from the Command Line” on page 119 for an introduction to the command line.

When you work with a CLI, you are working with a shell (Chapters 5, 9, and 27). When you are working on the command line it is important to quote special characters as explained on page 142.

More utilities are covered throughout the book

When Linus Torvalds introduced Linux and for a long time thereafter, Linux did not have a GUI (graphical user interface): It ran on character-based terminals only, using a CLI (command-line interface), also referred to as a textual interface. All the tools ran from a command line. Today the Linux GUI is important, but many people—especially system administrators—run many command-line utilities. Command-line utilities are often faster, more powerful, or more complete than their GUI counterparts. Sometimes there is no GUI counterpart to a textual utility; some people just prefer the hands-on feeling of the command line. This chapter describes a number of frequently used utilities and concludes with tutorials on the vim and nano text editors. See “Working from the Command Line” on page 119 for an introduction to the command line.

When you work with a CLI, you are working with a shell (Chapters 5, 9, and 27). When you are working on the command line it is important to quote special characters as explained on page 142.

More utilities are covered throughout the book

Basic Utilities

One of the advantages of Linux is that it comes with thousands of utilities that perform myriad functions. You will use utilities whenever you work with Linux, whether you use them directly by name from the command line or indirectly from a graphical menu or icon. The following sections discuss some of the most basic and important utilities that are available from a CLI. Some of the more important utilities are also available from a GUI; others are available only from a GUI.

Run these utilities from a command line

LPI cat: Joins and Displays Files

The cat utility joins and copies files to standard output. The name of the cat utility is derived from catenate, which means to join together, one after the other. You can also use cat to display virtual system files in the /proc directory hierarchy as explained on page 512.

Arguments

The arguments are the pathnames of one or more files that cat processes. You can use cat to display the contents of one or more text files on the screen. More precisely, cat copies the files to standard output, which by default is attached to the screen.
$ cat practice
   This is a small file that I created
   using: a text editor!

End.

If you do not specify an argument or if you specify a hyphen (–) in place of a filename, cat reads from standard input. The following example shows cat working without an argument; the < symbol causes the shell to redirect standard input to cat to come from practice. The shell passes no arguments to cat.

$ cat < practice
   This is a small file that I created
   using: a text editor!

End.

You can use cat to create short, simple files. See “The Keyboard and Screen as Standard Input and Standard Output” on page 152 and “Redirection” on page 153 for more examples of redirecting the standard input and standard output of cat.

OPTIONS

Number The –n (––number) option numbers all lines as they are written to standard output while the –b (––number-nonblank) numbers only non-blank lines.

$ cat -n practice
   1 This is a small file that I created
   2 using: a text editor!
   3
   4 End.

Tabs The –T (––show-tabs) option displays tabs as ^I.

$ cat -T practice
   This is a small file that I created
   using: ^Ian text editor!

End.

You can combine options like this

$ cat -bT practice

Or, using long options, like this

$ cat --number-nonblank --show-tabs practice

Nonprinting The –v (––show-nonprinting) option displays control characters using the caret notation (e.g., ^M means CONTROL-M) and displays characters that have the high bit set (meta characters) using the M- notation (e.g., M-M means META-M). This option does not convert tabs and linefeeds. Use –T (––show-tabs) if you want to display tabs as ^I. Linefeeds cannot be displayed as anything but themselves; otherwise, the line could be too long.
Chapter 7  The Linux Utilities

Related Utilities

tac  The tac (cat spelled backwards) utility works the same way as cat works except it reverses the order of the lines in each file.
rev  The rev (reverse) utility works the same way as cat works except it reverses the order of the characters in each line.

LPI  date: Displays the System Time and Date

Without any arguments, the date utility displays the date and time known to the local system. If you set up a locale database (page 368), date uses that database to substitute in its output terms appropriate to the locale for your account. Use timedatectl (page 613) to set the system clock.

```bash
$ date
Mon Aug 19 14:39:55 PDT 2013
```

The hardware clock and the system clock

Tip  The hardware clock is the time kept in the BIOS (page 31). This clock is battery powered and keeps time even when the computer is off. The system clock runs only while the system is running and is what Linux uses when it needs to know the time. On some systems the system clock is adjusted periodically by NTP (Network Time Protocol; page 315) so it stays accurate.

Arguments

The following example formats and specifies the contents of the output of date. See the date man page for a complete list of format sequences.

```bash
$ date +"%A %B %d"
Monday August 19
```

Options

Date  The –d datestring (––date=datestring) option displays the date specified by datestring, not the date known to the system. According to the date man page, “the datestring is a mostly free-format date string” such as 2pm next thursday. See DATE STRING in the date man page for details about the syntax of datestring. This option does not change the system clock.

UTC  The –u (––utc or –universal) option displays or sets the time and date using UTC (Universal Coordinated Time; page 1279). UTC is also called GMT (Greenwich Mean Time).

```bash
$ date -u
Mon Aug 19 21:40:19 UTC 2013
```

Related Utilities

timedatectl  The timedatectl utility, which is part of systemd (page 438), displays more information about the system clock. You can also use it to set the system clock. See page 613.

cal  The cal utility displays a calendar for the month and year you specify. Without any arguments it displays a calendar for the current month.

ARGUMENTS

The following example formats and specifies the contents of the output of date. See the date man page for a complete list of format sequences.

```bash
$ date +"%A %B %d"
Monday August 19
```

OPTIONS

Date  The –d datestring (––date=datestring) option displays the date specified by datestring, not the date known to the system. According to the date man page, “the datestring is a mostly free-format date string” such as 2pm next thursday. See DATE STRING in the date man page for details about the syntax of datestring. This option does not change the system clock.

UTC  The –u (––utc or –universal) option displays or sets the time and date using UTC (Universal Coordinated Time; page 1279). UTC is also called GMT (Greenwich Mean Time).

```bash
$ date -u
Mon Aug 19 21:40:19 UTC 2013
```
**echo: DISPLAYS ARGUMENTS**

The `echo` utility copies its arguments, followed by a newline, to standard output. The Bourne Again Shell has an `echo` builtin that works similarly to the `echo` utility.

The `echo` builtin/utility is a good tool for learning about the shell and other Linux utilities. Some examples on page 166 use `echo` to illustrate how special characters, such as the asterisk, work. Throughout Chapters 5, 9, and 27, `echo` helps explain how shell variables work and how you can send messages from shell scripts to the screen. You can even use `echo` to create a short file by redirecting its output:

```
$ echo "This is a short file." > short
$ cat short
This is a short file.
```

**Arguments**

The arguments can include quoted strings, ambiguous file references, and shell variables. The shell recognizes and expands unquoted special characters in arguments.

The following example shows `echo` copying its arguments to standard output. The second command includes an unquoted asterisk (*; page 166) that the shell expands into a list of files in the working directory before passing that list as arguments to `echo`; `echo` copies this list to standard output.

```
$ echo This is a sentence.
This is a sentence.
$ echo *: *
star: memo memo.0714 practice
$ ls
memo memo.0714 practice
```

**Option**

The `-n` option suppresses the newline that normally terminates the output of `echo`. This option is useful in shell scripts when you want to prompt a user and have the response appear on the same line as the prompt. See page 1041 for an example of a shell script that uses this feature.

**hostname: DISPLAYS THE SYSTEM NAME**

The `hostname` utility displays the name of the system you are working on. Use this utility if you are not sure that you are logged in on the correct machine. See also `/etc/hostname` on page 507.

```
$ hostname
guava
```

**Option**

The following option works with `hostname`.

- `--fqdn` The `-f` option displays the FQDN (page 1250) of the local system.

**Related Utility**

The `hostnamectl` utility, which is part of systemd (page 438), displays more information about the local system. You can also use it to change the hostname.
**LE**  less IS more: DISPLAY A TEXT FILE ONE SCREEN AT A TIME

You can use the less or more utilities, called *parsers*, to view a long text file one screen at a time. Each of these utilities pauses after displaying a screen of text. You can then press the SPACE bar to display the next screen of text.

Although less and more are very similar, they have subtle differences. The less utility, for example, allows you to move backward while viewing a file in some situations where more does not. Whereas more must read an entire file before displaying anything, less does not have to and so starts more quickly than more when displaying a large file. At the end of the file less displays an END message and waits for you to press q before returning you to the shell. In contrast, more returns you directly to the shell. While using both utilities you can press h to display a Help screen that lists commands you can use while paging through a file. Give the command less /etc/services to experiment with paging through a file.

**ARGUMENTS**

Both less and more take the names of files you want to view as arguments. If you do not specify an argument or if you specify a hyphen (–: less only) in place of a filename, less and more read from standard input.

**OPTIONS**

The following options work with less.

- **Clear screen**
  - The –c (–--clear-screen) option paints each new screen from the top down; by default less scrolls the display.

- **EOF**
  - The –e (–--quit-at-eof) option causes less to exit when it reaches the second EOF (when you press SPACE while less is displaying END at the end of a file) so you do not need to type q to quit.

- **Truncate**
  - The –S (–--chop-long-lines) option truncates lines wider than the screen. By default less wraps long lines.

- **No initialization**
  - The –X (–--no-init) option prevents less from sending terminal initialization and deinitialization strings to the terminal. By default, less clears the screen when it finishes; this option causes the last page of what you were viewing to remain on the screen.

**optional**

You can set the LESS environment variable (page 1032) in your ~/.bash_profile file (page 330) to set options for less each time you call it and when it is called from another program such as man. For example, the following line in the .bash_profile file in your home directory will cause less to always run with the –X option.

```
export LESS='--X'
```

**RELATED UTILITY**

most

The most utility (part of the most package; see page 534 for installation instructions) is newer and more capable than less and more. See the most man page for details.
**ls: Displays Information About Files**

The `ls` utility displays information about one or more files. It lists the information alphabetically by filename unless you use an option to change the order.

When you do not provide an argument, `ls` displays the names of the visible files (those with filenames that do not begin with a period; page 180) in the working directory.

**Arguments**

The arguments are one or more pathnames of any ordinary, directory, or device files. The shell expands ambiguous file references (page 165) in the arguments.

When you specify an ordinary file as an argument, `ls` displays information about that one file. When the argument is a directory, `ls` displays the contents of the directory. It displays the name of the directory only when needed to avoid ambiguity, such as when the listing includes more than one directory:

```bash
$ ls memos.zach/130715.1
memos.zach/130715.1

$ ls memos.zach
130712.1 130714.2 130714.3 130715.1

$ ls memos.*
memos.max:
 130619.1 130621.2 130622.1

memos.sam:
 130811.2 130811.3 130812.1

memos.zach:
 130712.1 130714.2 130714.3 130715.1
```

**Options**

Options determine the type of information `ls` displays, and the manner and order in which it displays the information. When you do not use an option, `ls` displays a short list that contains just the names of files, in alphabetical order. See page 145 for examples of how options affect `ls` output.

- **All** The `-a` (`--all`) option includes hidden filenames (those filenames that begin with a period; page 180) in the listing. Without this option `ls` does not list information about files with hidden filenames unless you specify the name of a hidden file as an argument. The `*` ambiguous file reference does not match a leading period in a filename, so you must use this option or explicitly specify a filename (ambiguous or not) that begins with a period to display information about files with hidden filenames.

- **Directory** The `-d` (`--directory`) option displays directories without displaying their contents.

```bash
$ ls -ld /
  dr-xr-xr-x. 27 root root 4096 07-16 18:37 /
```

This option is useful when you want to find out, for example, the name of the user who owns a directory in a large directory such as `/etc`. Instead of scrolling through
the output of `ls -l /etc` looking for a directory, you can give the command `ls -ld /etc/filename` (e.g., `ls -ld /etc/cron.d`).

**Human readable**

The `-h` (`--human-readable`) option, when specified with the `-l` option, displays sizes in K (kilobyte), M (megabyte), and G (gigabyte) blocks, as appropriate. This option works with the `-l` and `-s` options only. It displays powers of 1,024. Use `--si` to display powers of 1,000.

```
$ ls -lh /usr/bin
...
-rwxr-xr-x. 1 root root     105K 05-08 00:45 tac
-rwxr-xr-x. 1 root root      68K 05-08 00:45 tail
-rwxr-xr-x. 1 root root      24K 08-01 01:08 tailf
-rwxr-xr-x. 1 root root      29K 05-02 08:55 talk
-rwxr-xr-x. 1 root root     340K 06-04 08:23 tar
...
```

**Long**

The `-l` (lowercase “el”; `--format=long`) option lists more information about each file. See page 191 for an explanation of this output. If standard output for a directory listing is sent to the screen, this option displays the number of blocks used by all files in the listing on a line before the listing.

**Recursive**

The `-R` (`--recursive`) option recursively lists directory hierarchies.

**Reverse**

The `-r` (`--reverse`) option displays the list of filenames in reverse sorted order.

**Size**

The `-s` (`--size`) option displays the number of 1,024-byte blocks allocated to the file. The size precedes the filename. With the `-l` option, this option displays the size in column 1 and shifts other items one column to the right. If standard output for a directory listing is sent to the screen, this option displays the number of blocks used by all files in the listing on a line before the listing. You can include the `-h` option to make the file sizes easier to read. The following example recursively lists the `memos` directory hierarchy in reverse size order.

```
$ ls -1Rrs memos
memos:
4 drwxrwxr-x. 2 sam sam 4096 04-29 14:11 memos.zach
4 drwxrwxr-x. 2 sam sam 4096 04-29 14:32 memos.sam
4 drwxrwxr-x. 2 sam sam 4096 04-30 14:15 memos.max

memos/memos.zach:
4 -rw-rw-r--. 1 sam sam 4064 04-29 14:11 130715.1
4 -rw-rw-r--. 1 sam sam 3933 04-29 14:11 130714.3
4 -rw-rw-r--. 1 sam sam 3317 04-29 14:11 130714.2
...
```

**rm: Removes a File (Deletes a Link)**

The `rm` utility removes hard and/or symbolic links to one or more files. Frequently this action results in the file being deleted. See page 203 for information on links.
ARGUMENTS

The arguments are the pathnames of the files whose links rm will remove. Removing the only (last) hard link to a file deletes the file (page 208). Removing a symbolic link deletes the symbolic link only.

Be careful when you use rm with ambiguous file references

caution

Because this utility enables you to remove a large number of files with a single command, use rm cautiously, especially when you are working with ambiguous file references. Never use rm with ambiguous file references while you are working with root privileges. If you have any doubts about the effect of an rm command with an ambiguous file reference, first use echo with the same file reference and evaluate the list of files the reference generates. Alternately, you can use the rm –i (––interactive) option.

OPTIONS

Force

The –f (––force) option, without asking for your consent, removes files for which you do not have write access permission. This option suppresses informative messages if a file does not exist.

Interactive

The –i (––interactive) option prompts you before removing each file. If you use –r (––recursive) with this option, rm also prompts you before examining each directory.

$ rm -ri memos
  rm: descend into directory 'memos'? y
  rm: descend into directory 'memos/memos.max'? y
  rm: remove regular file 'memos/memos.max/130621.2'? y
  rm: remove regular file 'memos/memos.max/130619.1'? n
  ...

You can create an alias (page 392) for rm –i and put it in a startup file (page 180) so rm always runs in interactive mode. The –i option is set up by default for the root user under Fedora/RHEL.

Recursive

The –r (––recursive) option deletes the contents of the specified directory, including all its subdirectories, and the directory itself. Use this option with caution; do not use it with wildcards (* and?).

Verbose

The –v (––verbose) option displays the name of each file as it is removed.

RELATED UTILITIES

shred

The shred utility overwrites a file to hide its contents and make it very difficult to recover the data that was stored in it. The –u (––remove) option causes shred to delete the file after overwriting it. The following command overwrites the file named myfile three times and then deletes it.

$ shred -u myfile

testdisk

The testdisk utility (testdisk package) scans, repairs, and sometimes can recover disk partitions. In some cases can undelete files. See the testdisk man page for details.
Chapter 7  The Linux Utilities

WORKING WITH FILES

This section describes utilities that copy, move, print, search through, display, sort, compare, and identify files.

Filename completion

tip After you enter one or more letters of a filename (as an argument) on a command line, press TAB, and the shell will complete as much of the filename as it can. When only one filename starts with the characters you entered, the shell completes the filename and places a SPACE after it. You can keep typing or you can press RETURN to execute the command at this point. When the characters you entered do not uniquely identify a filename, the shell completes what it can and waits for more input. If pressing TAB does not change the display, press TAB again to display a list of possible completions. For more information refer to “Pathname Completion” on page 389.

LE+ cop: COPIES Files

The cp utility copies one or more files. Use scp (page 695) or rsync (page 696) to copy files from one system to another (or to make local copies). See page 237 for a description of the related mv (move) utility.

ARGUMENTS

With two arguments that are pathnames, neither of which specifies a directory, cp copies the file named by the first argument to the file named by the second argument.

$ cp memo memo.cp

With two or more arguments that are pathnames, the last of which is an existing directory, cp copies the files named by all but the last argument to the directory named by the last argument.

$ cp memo1 memo2 memo4 memo.dir

cp can destroy a file

caution If the destination file exists before you give a cp command, cp overwrites it. Because cp overwrites (and destroys the contents of) an existing destination file without warning, you must take care not to cause cp to overwrite a file that you need. The cp -i (interactive) option prompts you before it overwrites a file.

The following example assumes the file named orange.2 exists before you give the cp command. The user answers y to overwrite the file.

$ cp -i orange orange.2

Options

Archive The -a (---archive) option attempts to preserve the owner, group, permissions, access date, and modification date of source file(s) while copying a directory recursively.

Backup The -b (---backup) option makes a backup copy of a file that would be removed or overwritten by cp. The backup copy has the same name as the destination file with a
tilde (~) appended to it. When you use both –b and –f, cp makes a backup copy when you try to copy a file over itself. For more backup options, search for Backup options in the coreutils info page.

**Force** The –f (—force) option causes cp to try to remove the destination file (when it exists but cannot be opened for writing) before copying the source file. This option is useful when the user copying a file does not have write permission to an existing file but does have write permission to the directory containing the file. Use this option with –b to back up a destination file before removing or overwriting it.

**Interactive** The –i (—interactive) option prompts you whenever cp would overwrite a file. If you respond with a string that starts with y or Y, cp copies the file. If you enter anything else, cp does not copy the file.

```
$ cp -i * ../memos.helen
  cp: overwrite '../memos.helen/130619.1'?
    y
  cp: overwrite '../memos.helen/130622.1'?  n
```

**Preserve** The –p (—preserve[=attr]) option creates a destination file with the same owner, group, permissions, access date, modification date, and ACLs as the source file. The –p option does not take an argument.

Without attr, —preserve works as described above. The attr is a comma-separated list that can include mode (permissions), ownership (owner and group), timestamps (access and modification dates), links (hard links), and all (all attributes).

**Recursive** The –R or –r (—recursive) option recursively copies directory hierarchies including ordinary files. The last argument must be the name of a directory.

**Verbose** The –v (—verbose) option displays the name of each file as cp copies it.

```
$ cp -rv memos memos.bak
  'memos' -> 'memos.bak'
  'memos/memos.max' -> 'memos.bak/memos.max'
  'memos/memos.max/130619.1' -> 'memos.bak/memos.max/130619.1'
  'memos/memos.max/130622.1' -> 'memos.bak/memos.max/130622.1'
  'memos/memos.sam' -> 'memos.bak/memos.sam'
  'memos/memos.sam/130811.3' -> 'memos.bak/memos.sam/130811.3'
  'memos/memos.sam/130811.2' -> 'memos.bak/memos.sam/130811.2'
  ...
```

**cut:** SELECTS CHARACTERS OR FIELDS FROM INPUT LINES

The cut utility selects characters or fields from lines of input and writes them to standard output. Character and field numbering start with 1. Although limited in functionality, cut is easy to learn and use and is a good choice when columns and fields can be specified without using pattern matching.

**Arguments**
Arguments to cut are pathnames of ordinary files. If you do not specify an argument or if you specify a hyphen (–) in place of a pathname, cut reads from standard input.
Options
Characters
The –c clist (—characters=clist) option selects the characters given by the column numbers in clist. The value of clist is one or more comma-separated column numbers or column ranges. A range is specified by two column numbers separated by a hyphen. A range of –n means columns 1 through n; n– means columns n through the end of the line.

The following example displays the permissions of the files in the working directory. The –c2-10 option selects characters 2 through 10 from each input line.

```bash
$ ls -l | cut -c2-10
```

```
otal 2944
rw-r-xr-x
rw-rw-r--
```

Input delimiter
The –d dchar (—delimiter=dchar) option specifies dchar as the input field delimiter. This option also specifies dchar as the output field delimiter unless you use the —output-delimiter option. The default delimiter is a TAB character. Quote dchar as necessary to protect it from shell expansion.

Fields
The –f flist (—fields=flist) option selects the fields specified by flist. The value of flist is one or more comma-separated field numbers or field ranges. A range is specified by two field numbers separated by a hyphen. A range of –n means fields 1 through n; n– means fields n through the last field. The field delimiter is a TAB character unless you use the –d option to change it.

The following example displays a list of full names as stored in the fifth field (–f5) of the /etc/passwd file. The –d option specifies that the colon character is the field delimiter.

```bash
$ cut -d: -f5 /etc/passwd
```

```
Sam the Great
Zach Brill
Max Wild
```

The next command outputs the size and name of each file in the working directory. The –f option selects the fifth and ninth fields from the input lines. The –d option tells cut to use SPACES, not TABS, as delimiters. The tr utility (page 258) with the –s option changes sequences of two or more SPACE characters to a single SPACE; otherwise, cut counts the extra SPACE characters as separate fields.

```bash
$ ls -l | tr -s ' ' ' ' | cut -f5,9 -d ' ' 
```

```
259 countout
9453 headers
1474828 memo
1474828 memos_save
```
Output delimiter

The \texttt{--output-delimiter=ochar} option specifies \texttt{ochar} as the output field delimiter. By default, the output field delimiter is the same as the input field delimiter (the \texttt{\tab} character unless you change it using \texttt{--d}). Quote \texttt{ochar} as necessary to protect it from shell expansion.

\textbf{diff: DISPLAYS THE DIFFERENCES BETWEEN TWO TEXT FILES}

The \texttt{diff} (difference) utility displays line-by-line differences between two text files. By default \texttt{diff} displays the differences as instructions that you can use to edit one of the files to make it the same as the other.

The \texttt{sdiff} utility is similar to \texttt{diff} but its output might be easier to read; its output is the same as that of the \texttt{diff \(\text{-y} \quad \text{--side-by-side}\)} option. Use the \texttt{diff3} utility to compare three files and \texttt{cmp} to compare nontext (binary) files.

\textbf{ARGUMENTS}

The \texttt{diff} utility commonly takes the pathnames of two ordinary files it is to compare as arguments.

When you call \texttt{diff} without any options, it produces a series of lines containing Add (\texttt{a}), Delete (\texttt{d}), and Change (\texttt{c}) instructions. Each of these lines is followed by the lines from the file you need to add to, delete from, or change, respectively, to make the files the same. A less than symbol (\texttt{<}) precedes lines from \texttt{file1}. A greater than symbol (\texttt{>}) precedes lines from \texttt{file2}. The \texttt{diff} output appears in the format shown in Table 7-1. A pair of line numbers separated by a comma represents a range of lines; a single line number represents a single line.

\begin{table}[h]
\centering
\begin{tabular}{|l|l|}
\hline
Instruction & Meaning (to change file1 to file2) \\
\hline
\texttt{line1\ a\ line2}, line3 \\
\texttt{>\ lines\ from\ file2} & Append \texttt{line2} through \texttt{line3} from \texttt{file2} after \texttt{line1} in \texttt{file1} \\
\hline
\texttt{line1}, line2 \texttt{d} line3 \\
\texttt{<\ lines\ from\ file1} & Delete \texttt{line1} through \texttt{line2} from \texttt{file1} \\
\hline
\texttt{line1}, line2 \texttt{c} line3, line4 \\
\texttt{<\ lines\ from\ file1} & Change \texttt{line1} through \texttt{line2} in \texttt{file1} to \texttt{line3} through \texttt{line4} from \texttt{file2} \\
\texttt{---} \\
\texttt{>\ lines\ from\ file2} & \\
\hline
\end{tabular}
\end{table}

The \texttt{diff} utility assumes you will convert the file named by the first argument to the file named by the second argument. The line numbers to the left of each of the \texttt{a}, \texttt{c}, or \texttt{d} instructions always pertain to the first file; the line numbers to the right of the instructions apply to the second file. To display instructions to convert the files in the opposite order, reverse the arguments.
Chapter 10

Objectives

After reading this chapter you should be able to:

- Explain the need for and the responsibility of a privileged user (root)
- Gain root privileges using su and sudo
- Describe the startup sequence using systemd
- Manage which services start at boot time
- List four characteristics of a well-maintained system
- Start and stop services on a running system
- Boot into single-user mode for system maintenance
- Shut down a running system
- Secure a system by applying updates, monitoring logs, and controlling access to files using SELinux, setuid permission, and PAM
- Use system administration tools to monitor and maintain the system
- List common steps for installing, configuring, and securing a server
- Configure a system using a static IP address or using DHCP
The job of a system administrator is to keep one or more systems in a useful and convenient state for users. On a Linux system, the administrator and user might both be you, with you and the computer being separated by only a few feet. Alternately, the system administrator might be halfway around the world, supporting a network of systems, with you being one of thousands of users. Or a system administrator can be one person who works part-time taking care of a system and perhaps is also a user of the system. In some cases several administrators might work together full-time to keep many systems running.

A well-maintained system:

- Runs quickly enough so users do not get frustrated waiting for the system to respond or complete a task
- Has enough storage to accommodate the reasonable needs of users
- Provides a working environment appropriate to each user’s abilities and requirements
- Is secure from malicious and accidental acts altering its performance or compromising the security of the data it holds and exchanges with other systems
- Is backed up regularly, with recently backed-up files readily available to users
- Has recent copies of the software that users need to get their jobs done
- Is easier to administer than a poorly maintained system

In addition, a system administrator should be available to help users with all types of system-related problems—from logging in to obtaining and installing software updates to tracking down and fixing obscure network issues.

Part III of this book breaks system administration into nine chapters.

- Chapter 9 covers bash (Bourne Again Shell) to a depth that you can use it interactively to administer a system and begin to understand complex administration shell scripts.
- Chapter 10 covers the core concepts of system administration, including working with root (Superuser) privileges, system operation, configuration tools and other useful utilities, general information about setting up and securing a server (including a section on DHCP), and PAM.
- Chapter 11 covers files, directories, and filesystems from an administrator’s point of view.
- Chapter 12 covers installing software on the system, including the use of yum, BitTorrent, and curl.
- Chapter 13 discusses how to set up local and remote printers that use the CUPS printing system.
• Chapter 14 explains how to rebuild the Linux kernel and work with GRUB, the Linux boot loader.

• Chapter 15 covers additional system administrator tasks and tools, including setting up users and groups, backing up files, scheduling tasks, printing system reports, and general problem solving.

• Chapter 16 goes into detail about how to set up a LAN, including setting up and configuring network hardware and configuring software.

• Chapter 17 describes how to set up virtual machines locally (gnome-boxes, KVM/QEMU, and VMware) and in the cloud (AWS).

Because Linux is readily configurable and runs on a wide variety of platforms, this chapter cannot discuss every system configuration or every action you might have to take as a system administrator. Instead, this chapter seeks to familiarize you with the concepts you need to understand and the tools you will use to maintain a Linux system. Where it is not possible to go into depth about a subject, the chapter provides references to other sources.

This chapter assumes you are familiar with the following terms:

- block device (page 1239)
- daemon (page 1245)
- device (page 1246)
- device filename (page 1247)
- disk partition (page 1247)
- environment (page 1249)
- filesystem (page 1250)
- fork (page 1250)
- kernel (page 1257)
- login shell (page 1259)
- mount (page 1261)
- process (page 1267)
- runlevel (page 1271)
- signal (page 1273)
- system console (page 1276)
- X server (page 1281)
- root filesystem (page 1271)

If there is a problem, check the log files

**tip** If something on the system is not working as expected, check the log files in /var/log. This directory holds many files and subdirectories. If you cannot connect to a server, also check the log files on the server.

If something does not work, see if the problem is caused by SELinux

**tip** If a server or other system software does not work properly, especially if it displays a permissions-related error message, the problem might lie with SELinux. To see whether SELinux is the cause of the problem, put SELinux in permissive mode and run the software again. If the problem goes away, you need to modify the SELinux policy. Remember to turn SELinux back on. See the tip on page 473 and refer to “Setting the Targeted Policy using system-config-selinux” on page 475.

If you cannot access a remote system, check the firewall

**tip** If a server does not appear to work or you cannot access a remote system, make sure the firewall is not the problem. On a non-production system, use systemctl to turn the firewall off (page 900) and see if the problem goes away. Then turn the firewall back on and open only the necessary port using firewall-cmd (page 906).
Running Commands with root Privileges

Some commands can damage the filesystem or crash the operating system. Other commands can invade users’ privacy or make the system less secure. To keep a Linux system up and running as well as secure, most systems are configured not to permit ordinary users to execute some commands and access certain files. Linux provides several ways for a trusted user to execute these commands and access these files. A user running with these privileges is sometimes referred to as an administrator, privileged user, or Superuser.

The Special Powers of a Privileged User

A user running with root privileges has the following powers—and more.

- Some commands, such as those that add new users, partition hard drives, and change system configuration, can be executed only by a user working with root privileges. Such a user can configure tools, such as sudo, to give specific users permission to perform tasks that are normally reserved for a user running with root privileges.

- Read, write, and execute file access and directory access permissions do not affect a user with root privileges. A user with root privileges can read from, write to, and execute all files, as well as examine and work in all directories.

Exceptions to these privileges exist. For example, SELinux mandatory access can be configured to limit root access to a file. Also, a user working with root privileges cannot make sense of an encrypted file without possessing the key.

- Some restrictions and safeguards that are built into some commands do not apply to a user with root privileges. For example, a user with root privileges can change any user’s password without knowing the old password.

Console Security

Linux is not secure from a person who has physical access to the computer. Additional security measures, such as setting boot loader and BIOS passwords, can help secure the computer. However, if someone has physical access to the hardware, as system console users typically do, it is very difficult to secure a system from that user.
When you are running with root privileges in a command-line environment, by convention the shell displays a special prompt to remind you of your status. By default, this prompt is (or ends with) a hashmark (#).

**Least privilege**

When you are working on any computer system, but especially when you are working as the system administrator (working with root privileges), perform any task while using the least privilege possible. When you can perform a task logged in as an ordinary user, do so. When you must run a command with root privileges, do as much as you can as an ordinary user, log in or use su or sudo so you have root privileges, complete the part of the task that has to be done with root privileges, and revert to being an ordinary user as soon as you can. Because you are more likely to make a mistake when you are rushing, this concept becomes even more important when you have less time to apply it.

**LE GAINING root PRIVILEGES**

Classically a user gained root privileges by logging in as the user named root or by giving an su (substitute user) command and providing the root password. More recently the use of sudo has taken over this classic technique of gaining root privileges. With sudo, the user logs in as herself, gives an sudo command, and provides her own password (not the root password) to gain root privileges. “Advantages of sudo” on page 428 discusses some of the advantages of sudo.

When an ordinary user executes a privileged command in a graphical environment, the system prompts for the root password or the user’s password, depending on how the system is set up.

Some distributions lock the root account by not assigning a root password. On these systems, you cannot gain root privileges using a technique that requires you to supply the root password unless you unlock the root account as explained on page 438. Fedora/RHEL assigns a root password when the system is installed, so you can use these techniques from the start.

**There is a root account, but no root password**

As installed, some systems (not Fedora/RHEL) lock the root account by not providing a root password. This setup prevents anyone from logging in to the root account (except when you bring the system up in single-user mode [page 450]). There is, however, a root account (a user with the username root—look at the first line in /etc/passwd). This account/user owns files (give the command ls -l/usr/bin) and runs processes (give the command ps -ef and look at the left column of the output). The root account is critical to the functioning of a Linux system.

When properly set up, the sudo utility enables you to run a command as though it had been run by a user logged in as root. This book uses the phrase working (or run) with root privileges to emphasize that, although you might not be logged in as root, when you use su or sudo you have the powers of the root user.

The following list describes some of the ways you can gain or grant root privileges. Some of these techniques depend on you supplying the password for the root
account. Again, if the root account is locked, you cannot use these techniques unless you unlock the root account (set up a root password), as explained on page 438. Other techniques depend on the sudoers file being set up to allow you to gain root privileges (page 433). If this file is not set up in this manner, you cannot use these techniques.

- When you bring the system up in single-user/rescue mode (page 450), you log in as the user named root.
- You can give an su (substitute user) command while you are logged in as yourself. When you then provide the root password, you will be running with root privileges. See page 425.
- The sudo utility allows specified users to run selected commands with root privileges while they are logged in as themselves. You can set up sudo to allow certain users to perform specific tasks that require root privileges without granting these users systemwide root privileges. See page 428.
- Once the system is up and running in multiuser mode (page 452), you can log in as root. When you then supply the root password, you will be running with root privileges.
- Some programs ask for a password (either your password or the root password, depending on the command and the configuration of the system) when they start or when you ask them to perform certain tasks. When you provide a password, the program runs with root privileges. You stop running as a privileged user when you quit using the program. This setup keeps you from remaining logged in with root privileges when you do not need or intend to be.

**Setuid file**

- Any user can create a setuid (set user ID) file. Setuid programs run on behalf of the owner of the file and have all the access privileges the owner has. While you are working with root privileges, you can change the permissions of a file owned by root to setuid. When an ordinary user executes a file that is owned by root and has setuid permissions, the program has effective root privileges. In other words, the program can do anything a program running with root privileges can do that the program normally does. The user’s privileges do not change. When the program finishes running, all user privileges are as they were before the program started. Setuid programs owned by root are both extremely powerful and extremely dangerous to system security, which is why a system contains very few of them. Examples of setuid programs that are owned by root include passwd, at, and crontab. For more information refer to “Setuid and Setgid Permissions” on page 196 and “Real UID Versus Effective UID” (next).

**Logging in**

The /etc/securetty file controls which terminals (ttys) a user can log in on as root.

Using the /etc/security/access.conf file, PAM controls the who, when, and how of logging in. Initially this file contains only comments. See page 476, the comments in the file, and the access.conf man page for details.
Running Commands with root Privileges

**Real UID Versus Effective UID**

A UID (user ID) is the number the system associates with a username. UID 0 is typically associated with the username root. To speed things up, the kernel keeps track of a user by UID, not username. Most utilities display the associated username in place of a UID.

The kernel associates two UIDs with each process: a real UID and an effective UID. The third column of the /etc/passwd file (or NIS/LDAP) specifies your real UID. When you log in, your real UID is associated with the process running the login shell. Because you have done nothing to change it, the effective UID associated with the process running the login shell is the same as the real UID associated with that process.

The kernel determines which privileges a process has based on that process’ effective UID. For example, when a process asks to open a file or execute a program, the kernel looks at the effective UID of the process to determine whether it is allowed to do so. When a user runs a setuid program (page 196), the program runs with the UID of the owner of the program, not the user running the program.

When this book uses the phrase run with root privileges or gain root privileges, it means run with an effective UID of 0 (root).

**Using su to Gain root Privileges**

When you install Fedora/RHEL, you assign a password to the root account. Thus you can use su to gain root privileges without any further setup.

The su (substitute user) utility can spawn a shell or execute a program with the identity and privileges (effective UID) of a specified user, including root.

**Do not allow root access over the Internet**

Prohibiting a user from logging in as root over a network is the default policy of Fedora/RHEL. The /etc/securetty file must contain the names of all devices you want a user to be able to log in on as root. You can, however, log in as root over a network using ssh (page 685). As shipped by Fedora/RHEL, PAM configuration for ssh does not call the modules that use the security or access.conf configuration files. Also, in /etc/ssh/sshd_config, Fedora/RHEL sets PermitRootLogin to yes (it is set by default) to permit root to log in using ssh (page 705). For a more secure system, change PermitRootLogin to no.
Follow `su` on the command line with the name of a user; if you are working with `root` privileges or if you know the user’s password, the newly spawned shell will take on the identity (effective UID) of that user.

When you give an `su` command without an argument, `su` defaults to spawning a shell with `root` privileges (you have to supply the `root` password). That shell runs with an effective UID of 0 (`root`).

**SPAWNING A `root` SHELL**

When you give an `su` command to work with `root` privileges, `su` spawns a new shell, which displays the `#` prompt. That shell runs with an effective UID of 0 (`root`). You can return to your normal status (and your former shell and prompt) by terminating this shell: Press `CONTROL-D` or give an `exit` command.

The `who` utility, when called with the arguments `am i`, displays the real UID (translated to a username) of the process that called it. The `whoami` utility displays the effective UID (translated to a username) of the process that called it. As the following example shows, the `su` utility (the same is true for `sudo`) changes the effective UID of the process it spawns but leaves the real UID unchanged.

```
s who am i
sam pts/2 2013-06-12 13:43 (192.168.206.1)
s whoami
sam
s su
Password: # who am i
sam pts/2 2013-06-12 13:43 (192.168.206.1)
# whoami
root
```

Giving an `su` command without any arguments changes your effective user and group IDs but makes minimal changes to the environment. For example, `PATH` has the same value as it did before you gave the `su` command. The `id` utility displays the effective UID and GID of the process that called it as well as the groups the process is associated with. In the following example, the information that starts with `context` pertains to SELinux:

```
$ who am i
sam pts/2 2013-06-12 13:43 (192.168.206.1)
$ whoami
sam
$ id
uid=1000(sam) gid=1400(pubs) groups=1400(pubs),10(wheel) context=unconfined_u: ... 
$ su
Password: 
# who am i
sam pts/2 2013-06-12 13:43 (192.168.206.1)
# whoami
root
```
# id
uid=0(root) gid=0(root) groups=0(root) context=unconfined_u: ...
# exit
exit
$

When you give the command `su -` (you can use `–l` or `--login` in place of the hyphen), `su` provides a root login shell: It is as though you logged in as `root`. Not only do the shell’s effective user and group IDs match those of `root`, but the environment is the same as when you log in as `root`. The login shell executes the appropriate startup files (page 329) before displaying a prompt, and the working directory is set to what it would be if you had logged in as `root` (`/root`). `PATH` is also set as though you had logged in as `root`. However, as `who` shows, the real UID of the new process is not changed from that of the parent process.

```
$ su -
Password:
# pwd
/root
# echo $PATH
/usr/local/sbin:/usr/local/bin:/sbin:/bin:/usr/sbin:/usr/bin:/root/bin
# who am i
sam pts/2 2013-06-12 13:43 (192.168.206.1)
```

**EXECUTING A SINGLE COMMAND**

You can use `su` with the `–c` option to run a command with root privileges, returning to the original shell when the command finishes executing. In the following example, Sam tries to display the `/etc/shadow` file when the command finishes executing. The `cat` utility displays an error message. When he uses `su` to run `cat` to display the file, `su` prompts him for a password, he responds with the `root` password, and the command succeeds. The quotation marks are necessary because `su –c` takes the command it is to execute as a single argument.

```
$ cat /etc/shadow
```

```
cat: /etc/shadow: Permission denied
```

```
$ su -c 'cat /etc/shadow'
Password:
root:$6$il96HvSfmvep.m2F$2RI1LZ ... fYc3wY2FQ/:15861:0:99999:7:::
bin:*:15839:0:99999:7:::
daemon:*:15839:0:99999:7:::
adm:*:15839:0:99999:7:::
...
```

The next example first shows that Sam is not permitted to kill (page 465) a process. With the use of `su –c` and the `root` password, however, Sam is working with `root` privileges and is permitted to kill the process.

```
$ kill -15 4982
-bash: kill: (4982) - Operation not permitted
$ su -c "kill -15 4982"
Password:
$
```
The final example combines the – and –c options to show how to run a single command with root privileges in the root environment:

```
$ su -c pwd
Password: /home/sam
$ su - -c pwd
Password: /root
```

**Root privileges, PATH, and security**

The fewer directories you keep in PATH when you are working with root privileges, the less likely you will be to execute an untrusted program while working with root privileges. If possible, keep only the default directories, along with /usr/bin and /usr/sbin, in root's PATH. Never include the working directory in PATH (as . or :: anywhere in PATH, or : as the last element of PATH). For more information refer to “PATH: Where the Shell Looks for Programs” on page 359.

**LE+ USING sudo TO GAIN root Privileges**

If sudo (www.sudo.ws) is not set up so you can use it, and a root password exists and you know what it is, see “Administrator and the wheel group” on the next page for instructions on setting up sudo so you can use it to gain root privileges.

**ADVANTAGES OF sudo**

Using sudo rather than the root-account for system administration offers many advantages.

- When you run sudo, it requests your password—not the root password—so you have to remember only one password.
- The sudo utility logs all commands it executes. This log can be useful for retracing your steps for system auditing and if you make a mistake.
- The sudo utility logs the username of a user who issues a sudo command. On systems with more than one administrator, this log tells you which users have issued sudo commands. Without sudo, you would not know which user issued a command while working with root privileges.
- The sudo utility allows implementation of a finer-grained security policy than does the use of su and the root account. Using sudo, you can enable specific users to execute specific commands—something you cannot do with the classic root account setup.
- Using sudo makes it harder for a malicious user to gain access to a system. When there is an unlocked root account, a malicious user knows the username of the account she wants to crack before she starts. When the root account is locked, the user has to determine the username and the password to break into a system.

**Root privileges, PATH, and security**

The fewer directories you keep in PATH when you are working with root privileges, the less likely you will be to execute an untrusted program while working with root privileges. If possible, keep only the default directories, along with /usr/bin and /usr/sbin, in root's PATH. Never include the working directory in PATH (as . or :: anywhere in PATH, or : as the last element of PATH). For more information refer to “PATH: Where the Shell Looks for Programs” on page 359.
rootpw  Causes `sudo` to accept only the `root` password in response to its prompt. Because `sudo` issues the same prompt whether it is asking for your password or the `root` password, turning this flag on might confuse users. Default is off, causing `sudo` to accept the password of the user running `sudo`.

shell_noargs  Causes `sudo`, when called without any arguments, to spawn a `root` shell without changing the environment. Default is off. This option causes the same behavior as the `sudo -s` option.

timestamp_timeout=mins  The `mins` is the number of minutes that the `sudo` timestamp (page 429) is valid. Set `mins` to −1 to cause the timestamp to be valid forever; set to 0 (zero) to cause `sudo` to always prompt for a password. Default is 5.

tty_tickets  Causes `sudo` to authenticate users on a per-tty basis, not a per-user basis. Default is on.

umask=val  The `val` is the umask (page 469) that `sudo` uses to run the command that the user specifies. Set `val` to 0777 to preserve the user's umask value. Default is 0022.

**LOCKING THE `root` ACCOUNT (REMOVING THE `root` PASSWORD)**

If you decide you want to lock the `root` account, give the command `su –c 'passwd –l root'`. This command renders the encrypted password in `/etc/shadow` invalid by preceding two exclamation points (!!) to it. You can unlock the account again by removing the exclamation points or by giving the command shown in the following example.

Unlocking the `root` account  If you decide you want to unlock the `root` account after locking it, give the following command. This command assumes you can use `sudo` to gain `root` privileges and unlocks the `root` account by assigning a password to it:

```
$ sudo passwd root
[sudo] password for sam:  
Changing password for user root.  
New password:  
Retype new password:  
passwd: all authentication tokens updated successfully.
```

**LPI**  THE systemd init DAEMON

The `init` daemon is the system and service manager for Linux. As explained on page 374, it is the first true process Linux starts when it boots and, as such, has a PID of 1 and is the ancestor of all processes. The `init` daemon has been around since the early days of UNIX, and many people have worked to improve it. The first Linux `init` daemon was based on the UNIX System V `init` daemon and is referred to as SysVinit (`System V init` daemon).

Because SysVinit does not deal well with modern hardware, including hotplug (page 516) devices, USB hard and flash drives, and network-mounted filesystems,
Fedora 15 replaced it with the systemd init daemon, which is described in this section. Several other replacements for SysVinit are also available. Ubuntu uses Upstart (upstart.ubuntu.com), Solaris uses SMF (Service Management Facility), and MacOS uses launchd.

The name systemd comprises system, which systemd manages, followed by d. Under UNIX/Linux, daemon names frequently end in d: systemd is the system daemon. At boot time, systemd renames itself init, so you will not see a process named systemd. However, init is simply a link to systemd:

```
$ ls -l /sbin/init
lrwxrwxrwx. 1 root root 22 05-28 12:17 /sbin/init -> ../lib/systemd/systemd
```

The name is also a play on words with System D, a reference to the French débrouillard (to untangle) or démerder. System D is a manner of responding to challenges that requires fast thinking, adapting, and improvising.

The systemd init daemon is a drop-in replacement for SysVinit; most of the administration tools that worked with SysVinit and Upstart work with systemd. Although systemd is relatively new, most of the user interfaces pertinent to administrators will remain stable (www.freedesktop.org/wiki/Software/systemd/InterfaceStabilityPromise).

**SERVICE UNITS AND TARGET UNITS**

The systemd init daemon is based on the concept of units, each of which has a name and type. Typically information about a unit is stored in a file that has the same name as the unit (e.g., dbus.service). The types of units are service, socket, device, mount, automount, target, snapshot, timer, swap, and path. This section discusses service and target units, which are critical to controlling daemons and runlevel under systemd.
Service unit
A service unit refers to a daemon (service) that systemd controls, including those controlled natively by systemd and those controlled by systemd via SysVinit init scripts. The systemd init daemon controls almost all services natively.

Target unit
A target unit groups other units. Of concern in this section are targets that control the system runlevel. By default, Fedora activates graphical.target, which brings the system to a runlevel that equates to what was formerly called runlevel 5 (multiuser graphical mode). Activating multi-user.target brings the system to what was formerly called runlevel 3 (multiuser textual mode). Table 10-1 on page 449 lists all predefined target units (runlevels).

Terminology:
A daemon, such as atd or cupsd, provides a service that runs on a server. The daemon itself is also sometimes referred to as a server. These three terms can be used interchangeably.

RUNLEVELS
The systemd init daemon does not support runlevels the way SysVinit did. It supports target units, which parallel runlevels but are different. To ease the transition, this book continues to use the term runlevel to refer to target units. One difference between SysVinit runlevels and systemd target units is that the former can be changed only when the system changes runlevels whereas the latter can be activated by any of a large group of triggers. Another difference is that a systemd-based system can activate more than one target unit at a time, allowing the system to be in more than one “runlevel” at a time. For example, graphical.target pulls in multi-user.target so they are both active at the same time.

WANTS AND REQUIRES
Under systemd, the terms wants and requires specify units that are to be activated when the unit that wants or requires the other unit is activated. A unit that requires another unit will not start if the other unit is not available. Wants is similar to requires, except a unit that wants another unit will not fail if the wanted unit is not available.

DISPLAYING PROPERTIES
The following systemctl show command displays the Requires properties of the graphical.target unit. It shows that graphical.target requires multi-user.target:

```
$ systemctl show --property "Requires" graphical.target
Requires=multi-user.target
```
This relationship causes systemd not to start \texttt{graphical.target} if \texttt{multi-user.target} is not available. It means \texttt{graphical.target} requires units that \texttt{multi-user.target} requires and wants units that \texttt{multi-user.target} wants. Because of this relationship, \texttt{multi-user.target} (runlevel) is active at the same time \texttt{graphical.target} (runlevel) is active.

You can also use the \texttt{systemctl show} command to display the Wants properties of a target:

\begin{verbatim}
$ systemctl show --property "Wants" multi-user.target
Wants=vmtoolsd.service abrt-xorg.service rpcbind.service ...

lines 1-1/1 (END) q
\end{verbatim}

The list is long. Although \texttt{systemctl} passes the output through a pager, it runs off the right edge of the screen. When the command displays (END), press \texttt{q} to return to the shell prompt. Sending the output through the \texttt{fmt} text formatter with a line-length specification of 10 displays the list one service per line:

\begin{verbatim}
$ systemctl show --property "Wants" multi-user.target | fmt -10
Wants=vmtoolsd.service
abrt-xorg.service
rpcbind.service
remote-fs.target
sm-client.service
sssd.service
...
\end{verbatim}

To see whether a target wants a specific service, send the output of the previous command through \texttt{grep}:

\begin{verbatim}
$ systemctl show --property "Wants" multi-user.target | fmt -10 | grep atd
Wants=atd.service
\end{verbatim}

The output shows that \texttt{multi-user.target} wants the \texttt{atd.service} service. Because \texttt{graphical.target} requires \texttt{multi-user.target} and \texttt{multi-user.target} wants \texttt{atd.service}, systemd will start \texttt{atd.service} when the system enters the runlevel defined by \texttt{graphical.target}.

\texttt{/etc/systemd/system HIERARCHY: CONTROLS SERVICES AND THE PERSISTENT RUNLEVEL}

The services wanted by a runlevel target appear in directories named \texttt{*.wants} under the \texttt{/etc/systemd/system} directory:

\begin{verbatim}
$ ls -ld /etc/systemd/system/*/wants
...  drwxr-xr-x. 2 root root 4096 06-04 19:29 /etc/systemd/system/graphical.target.wants
  drwxr-xr-x. 2 root root 4096 06-05 19:44 /etc/systemd/system/multi-user.target.wants
...
\end{verbatim}

The following command lists the runlevel targets that want \texttt{atd.service}:

\begin{verbatim}
$ ls /etc/systemd/system/*/wants/atd.service
/etc/systemd/system/multi-user.target.wants/atd.service
\end{verbatim}

As explained in the previous section, you can also display this information using the \texttt{systemctl show} command.
The directory hierarchy with its root at `/etc/systemd/system` controls the persistent runlevel of the system. That is, this directory hierarchy specifies which daemons will be started when the system boots or otherwise changes runlevel or when the daemon is activated for another reason.

All service unit files are kept in the `/lib/systemd/system` directory. All plain files in the `/etc/systemd/system` hierarchy are links to files in the `/usr/lib/systemd/system` or `/lib/systemd/system` hierarchy. For example, `atd.service` shown in the preceding example is a link to the appropriate service unit file in `/usr/lib/systemd/system`:

```
$ ls -l /etc/systemd/system/multi-user.target.wants/atd.service
lrwxrwxrwx. 1 root root 35 07-02 12:56 /etc/systemd/system/multi-user.target.wants/atd.service -> /usr/lib/systemd/system/atd.service
```

The service unit file provides systemd with information it needs to start the service and specifies the system runlevel target that wants the service:

```
$ cat /lib/systemd/system/atd.service
[Unit]
Description=Job spooling tools
After=syslog.target systemd-user-sessions.service

[Service]
EnvironmentFile=/etc/sysconfig/atd
ExecStart=/usr/sbin/atd -f $OPTS

[Install]
WantedBy=multi-user.target
```

When you instruct systemd to start a service when the system boots (make the service persistent), it places a link to the service file in the directory specified by WantedBy in the service file. Continuing with the example, systemd places a link to `atd.service` in the `multi-user.target.wants` directory as shown previously. When you instruct systemd to not start a service when the system boots, it removes the link. “Setting the Persistent State of a Daemon” on page 445 explains how to use `systemctl` to make these changes.

The persistent (default) runlevel is also controlled by a link:

```
$ ls -l /etc/systemd/system/default.target
lrwxrwxrwx. 1 root root 36 06-04 19:34 /etc/systemd/system/default.target -> /lib/systemd/system/graphical.target
```

See “Setting the Persistent Runlevel” on page 444 for more information.

**Custom Service Files**

As explained in the previous section, files in the `/etc/systemd/system` directory hierarchy are symbolic links to files in the `/lib/systemd/system` directory hierarchy. The systemd `init` daemon treats files in the `/etc/systemd/system` directory hierarchy and files in the `/lib/systemd/system` directory hierarchy the same way, with files in `/etc/systemd/system` overriding files with the same name in `/lib/systemd/system`. An important difference between these directory hierarchies is that `/lib/systemd/system` is managed by `yum/RPM` while `/etc/systemd/system` is managed by the system administrator.
Put custom service files in the `/etc/systemd/system` hierarchy. If you want to modify a service file, copy it from the `/lib/systemd/system` hierarchy to the `/etc/systemd/system` hierarchy and edit the copy. The custom file in the `/etc/systemd/system` hierarchy will not be overwritten by `yum/RPM` and will take precedence over a file with the same name in the `/lib/systemd/system` hierarchy.

**DETERMINING WHETHER systemd RUNS A Daemon NATIVELY**

To ease migration from SysVinit to systemd and to provide compatibility with software intended for other distributions, systemd can control daemons via SysVinit scripts (page 448). You can use the `systemctl status` command to determine whether systemd is controlling a daemon natively or via a SysVinit script. Following, `systemctl` displays the status of `cups` and `network`:

```
$ systemctl status cups.service
```

```
cups.service - CUPS Printing Service
   Loaded: loaded (/usr/lib/systemd/system/cups.service; enabled)
   Active: active (running) since Wed 2013-06-05 17:29:38 PDT; 2h 30min ago
```

```
$ systemctl status network.service
```

```
network.service - LSB: Bring up/down networking
   Loaded: loaded (/etc/rc.d/init.d/network)
   Active: inactive (dead)
```

The `systemctl` utility does not require a period and unit type (`.service` in the preceding example) following a unit name (`cups` and `network` in the preceding example). The lines that start with `Loaded` name the file controlling each daemon (service). The `cups` daemon is controlled by `/usr/lib/systemd/system/cups.service`. The location of the file (the `/usr/lib/systemd` hierarchy) and its filename extension (`.service`) indicate systemd is running the daemon natively. The `network` daemon is controlled by `/etc/rc.d/init.d/network`. The location of the file (the `init.d` directory) and the lack of a filename extension indicate systemd is running the daemon via a SysVinit script. See `fedoraproject.org/wiki/User:Johannbg/QA/Systemd/compatibility` for a list of services that have been ported to systemd (and are run natively by systemd).

*un* `service`

Although it is deprecated, you can use `service` to display information similar to that displayed by `systemctl status`. However, `service` does not accept a period and unit type.

```
$ service cups status
```

```
Redirecting to /bin/systemctl status cups.service
```

```
cups.service - CUPS Printing Service
   Loaded: loaded (/usr/lib/systemd/system/cups.service; enabled)
   Active: active (running) since Wed 2013-06-05 17:29:38 PDT; 2h 30min ago
```

```
$ service network status
```

```
Configured devices:
   lo Wired_connection_1 ens33
Currently active devices:
   lo ens33
```
Chapter 10  System Administration: Core Concepts

Setting and Changing Runlevels

The runlevel specifies which daemons are running and which interfaces are available on a system. See “Runlevels” on page 440 and Table 10-1 on page 449 for more information. This section describes how to set the persistent (default) runlevel (the runlevel the system boots to) and how to change the current runlevel.

**LPI Setting the Persistent Runlevel**

Under systemd no true runlevels exist; see “Runlevels” on page 449. For example, the default runlevel under Fedora is `graphical.target` and has an alternative name of `runlevel5.target`. Under SysVinit this runlevel is referred to as runlevel 5 (multiuser graphical mode). The `/etc/systemd/system/default.target` file is a link to the file that specifies the target the system will boot to by default:

```
$ ls -l /etc/systemd/system/default.target
lrwxrwxrwx. 1 root root 36 06-04 19:34 /etc/systemd/system/default.target -> /lib/systemd/system/graphical.target
```

The following command shows `runlevel5.target` is a link to `graphical.target`:

```
$ ls -l /lib/systemd/system/runlevel5.target
lrwxrwxrwx. 1 root root 16 06-04 20:02 /lib/systemd/system/runlevel5.target -> graphical.target
```

The `multi-user.target` file (and the link to it, `runlevel3.target`) causes the system to boot to the multiuser runlevel (multiuser textual mode; SysVinit runlevel 3). The following command replaces the link shown in the previous example and will cause the system enter multiuser textual mode each time it is booted. This command does not change the current runlevel. (Newer versions of systemd use the command `systemctl set-default target`, where `target` is replaced with the new runlevel target, in place of the following `ln` command.)

```
# ln -sf /lib/systemd/system/multi-user.target /etc/systemd/system/default.target
```

The `ln --symbolic` option creates a symbolic link, and the `-f` (force) option overwrites any existing file.

The `systemctl list-units` command with the `--type=target` option lists all active target units. Before rebooting the system, this command shows that both `graphical.target` and `multi-user.target` are active.

```
$ systemctl list-units --type=target | egrep 'multi-user|graphical'
graphical.target  loaded active active Graphical Interface
multi-user.target  loaded active active Multi-User System
```

After giving the `ln` command and rebooting the system, `graphical.target` is no longer active but `multi-user.target` is:

```
$ systemctl list-units --type=target | egrep 'multi-user|graphical'
multi-user.target  loaded active active Multi-User System
```

See page 452 for instructions on how to boot to a specific runlevel using target units.
**LPI Changing the Current Runlevel**

The `systemctl isolate` command changes the current runlevel of the system. The following command changes the runlevel to multiuser graphical mode (`graphical.target`). When the system is rebooted, it will return to the default runlevel as specified by the link at `/etc/systemd/system/default.target`.

```
# systemctl isolate graphical.target
```

After a moment `systemctl` shows that, again, both `graphical.target` and `multi-user.target` are active:

```
$ systemctl list-units --type=target | egrep 'multi-user|graphical'
graphical.target    loaded active active Graphical Interface
multi-user.target   loaded active active Multi-User System
```

The preceding examples were run from an `ssh` login. If you give these commands from a terminal emulator running on the console, the system will log you out each time it changes runlevels.

**LPI Configuring Daemons (Services)**

Two states are important when you consider a daemon: its current state and its persistent state (the state it will be in after the system is booted). Possible states are running and stopped. When you install a package that includes a daemon, the daemon is stopped and is not set up to start when the system is booted.

The `systemctl` utility controls the current and persistent states of daemons that run natively under systemd. The `service` and `chkconfig` utilities originally controlled daemons that run under SysVinit and were upgraded to control daemons that run under Upstart. Now these utilities have been retrofitted to control daemons that run under systemd, which they do by calling `systemctl`. You can still use `service` to control the current state of a daemon and `chkconfig` to control the persistent state of a daemon.

The next sections describe the `systemctl` commands that control daemons.

**Setting the Persistent State of a Daemon**

The `systemctl disable` command causes a daemon not to start when the system is booted. This command has no effect on the current state of the daemon. You do not need to specify the `.service` part of the service name.

```
# systemctl disable atd.service
rm '/etc/systemd/system/multi-user.target.wants/atd.service'
```

The preceding command removes the link that causes systemd to start `atd` when the system enters multi-user runlevel and, by inheritance, graphical runlevel. See “/etc/systemd/system Hierarchy: Controls Services and the Persistent Runlevel” on page 441 for a discussion of these links.

The following commands each verify that the `atd` daemon will not start when the system boots. The first command shows no links in the `*.wants` directories for

Objectives

After reading this chapter you should be able to:

- Explain what sendmail is
- Explain the purpose and give examples of an MUA, an MTA, and an MDA
- Describe the role of SMTP, IMAP, and POP
- Configure the local SMTP service to use a smarthost for outgoing mail
- Configure the local SMTP server to accept incoming mail, relay outgoing mail for specific hosts, and deliver mail directly to the remote systems
- Configure mail aliases and mail forwarding
- Install and configure SpamAssassin on a mail client and a mail server
- Install and configure a Webmail service (SquirrelMail)
- Setup a mailing list (Mailman)
- Install and configure an IMAP server (Dovecot)
- Describe the process and purpose of authenticated relaying
Sending and receiving email require three pieces of software. At each end, there is a client, called an MUA (mail user agent), which is a bridge between a user and the mail system. Common MUAs are Evolution, KMail, Thunderbird, mutt, and Outlook. When you send an email, the MUA hands it to an MTA (mail transfer agent, such as exim4 or sendmail), which transfers it to the destination server. At the destination, an MDA (mail delivery agent, such as procmail) puts the mail in the recipient’s mailbox file. On Linux systems, the MUA on the receiving system either reads the mailbox file or retrieves mail from a remote MUA or MTA, such as an ISP’s SMTP (Simple Mail Transfer Protocol) server, using POP (Post Office Protocol) or IMAP (Internet Message Access Protocol).

SMTP Most Linux MUAs expect a local MTA such as sendmail to deliver outgoing email. On some systems, including those with a dial-up connection to the Internet, the MTA sends email to an ISP’s mail server. Because most MTAs use SMTP (Simple Mail Transfer Protocol) to deliver email, they are often referred to as SMTP servers.

You do not need to set up sendmail to send and receive email

Tip Most MUAs can use POP or IMAP to receive email from an ISP’s server. These protocols do not require an MTA such as sendmail. As a consequence, you do not need to install or configure sendmail (or another MTA) to receive email. Although you still need SMTP to send email, the SMTP server can be at a remote location, such as your ISP. Thus you might not need to concern yourself with it either.

In the default Fedora setup, the sendmail MTA uses procmail as the local MDA. In turn, procmail writes email to the end of the recipient’s mailbox file. You can also use procmail to sort email according to a set of rules, either on a per-user basis or globally. The global filtering function is useful for systemwide filtering to detect spam and for other tasks, but the per-user feature is largely superfluous on a modern system. Traditional UNIX MUAs were simple programs that could not filter mail and thus delegated this function to MDAs such as procmail. Modern MUAs, by contrast, incorporate this functionality. Although by default RHEL uses postfix as the MTA, this chapter explains how to set up sendmail as the MTA.

LPI Introduction to sendmail

When the network that was to evolve into the Internet was first set up, it connected a few computers, each serving a large number of users and running several services. Each computer was capable of sending and receiving email and had a unique hostname, which was used as a destination for email.

Today the Internet has a large number of transient clients. Because these clients do not have fixed IP addresses or hostnames, they cannot receive email directly. Users on these systems usually maintain an account on an email server run by their employer or an ISP, and they collect email from this account using POP or IMAP. Unless you own a domain where you want to receive email, you will not need to set up sendmail to receive mail from nonlocal systems.
Outbound Email

When used as a server, sendmail accepts outbound email and directs it to the system it is addressed to (the destination system). This section describes the different ways you can set up sendmail to perform this task.

Accepting Email for Delivery

You can set up a sendmail server so it accepts outbound email from the local system only, from specified systems (such as a LAN), or from all systems. Accepting email from unknown systems makes it likely the server will propagate spam.

Delivering Email

Direct connection

You can set up a sendmail server so it connects directly to the SMTP server on nonlocal destination systems. This SMTP server then delivers the email. Typically, sendmail delivers local email directly.

Smarthost

Alternately, you can set up a sendmail server so it sends email bound for nonlocal systems to an SMTP server that relays the mail to its destination. This type of server is called a smarthost or SMTP relay.

Port 25

By default, SMTP uses port 25. Some Windows viruses use a simple, self-contained SMTP server to propagate themselves. As a partial defense against these types of viruses, some ISPs and larger organizations block all outgoing connections that originate or terminate on port 25, with the exception of connections to their own SMTP server (smarthost). Blocking this port prevents local systems from making a direct connection to send email. These organizations require you to use a smarthost for email bound for nonlocal systems.

Inbound Email

Although not typical, you can set up sendmail to accept email for a registered domain name as specified in the domain’s DNS MX record (page 859). However, most mail clients (MUAs) do not interact directly with sendmail to receive email. Instead, they use POP or IMAP—protocols that include features for managing mail folders, leaving messages on the server, and reading only the subject of an email without downloading the entire message. If you want to collect email from a system other than the one running the incoming mail server, you might need to set up a POP or IMAP server, as discussed on page 763.

LPI Alternatives to sendmail

Over the years, sendmail has grown to be enormously complex. Its complexity makes it challenging to configure if you want to set up something more than a simple mail server. Its size and complexity also add to its vulnerability. For optimal security, make sure you run the latest version of sendmail and always keep sendmail up-to-date. Or you might want to consider using one of the following alternatives.
Chapter 20 sendmail: Setting Up Mail Servers, Clients, and More

The default MTA under Ubuntu, **exim4** (www.exim.org; **exim** package), was introduced in 1995 by the University of Cambridge. It can be configured in several different ways and includes many features other MTAs lack.

**Postfix** (www.postfix.org; **postfix** package) is an alternative MTA. Postfix is fast and easy to administer but is compatible enough with **sendmail** to not upset **sendmail** users. Postfix has a good reputation for ease of use and security and is a drop-in replacement for **sendmail**.

**Qmail** (www.qmail.org) is a direct competitor of Postfix and has the same objectives. By default, Qmail stores email using the **maildir** format as opposed to the **mbox** format that other MTAs use (page 745).

Local
- Dovecot: /usr/share/doc/dovecot*
- man pages: sendmail, aliases, makemap, spamassassin spamc spamd
- SpamAssassin: /usr/share/doc/spamassassin*, give the following command:

  ```
  $ perldoc Mail::SpamAssassin::Conf
  ```

LPI Setting Up a sendmail Mail Server

This section explains how to set up a **sendmail** mail server.

Prerequisites

Install the following packages:

- **sendmail**
- **sendmail-cf** (required to configure **sendmail**)

As installed, **sendmail** is active and enabled so it will run when the system is booted. After changing its configuration files, give the following command to restart **sendmail**, causing it to reread its configuration files:

  ```
  # systemctl restart sendmail.service
  ```
JumpStart I: Configuring sendmail on a Client

Notes

Firewall
An SMTP server normally uses TCP port 25. If an SMTP server system that receives nonlocal mail is running a firewall, you need to open this port. Give the following commands to open the port each time the system boots (permanently) and on the running system; see page 906 for information on firewall-cmd.

```
$ sudo -c 'firewall-cmd --add-port=25/tcp'
$ sudo -c 'firewall-cmd --permanent --add-port=25/tcp'
```

cyrus
This chapter covers the IMAP and POP3 servers included in the dovecot package. Fedora/RHEL also provides IMAP and POP3 servers in the cyrus-imapd package.

FQDN
If the local system does not have an FQDN (page 1250), sendmail will start very slowly. As a consequence, the system might boot slowly. See /etc/hostname on page 507 for instructions on how to determine if the system has an FQDN and how to give the local system an FQDN.

LPI JumpStart I: Configuring sendmail on a Client

You might not need to configure sendmail to send email

Tip
With sendmail running, give the command described under “Test” on page 744. As long as sendmail can connect to port 25 outbound, you should not need to set up sendmail to use an SMTP relay as described in this section. If you receive the mail sent by the test, you can skip this section. However, see “FQDN,” above.

This JumpStart configures an outbound sendmail server. This server

- Uses a remote SMTP server—typically an ISP—to relay outbound email to its destination (a smarthost or SMTP relay).
- Sends to the SMTP server email originating from the local system only. It does not forward email originating from other systems.
- Does not handle inbound email. As is frequently the case, you need to use POP or IMAP to receive email.

Change

To set up this server, you must edit /etc/mail/sendmail.mc and restart sendmail (page 742).

The dnl (page 749) at the start of the following line in sendmail.mc indicates that this line is a comment:

```
dnl define('SMART_HOST', 'smtp.your.provider')dnl
```

You can ignore the dnl at the end of the line. To specify a remote SMTP server, you must open sendmail.mc in an editor and change the preceding line, deleting dnl from the beginning of the line and replacing smtp.your.provider with the FQDN of your
ISP’s SMTP server (obtain this name from your ISP). Be careful not to alter the back ticks (``) and the single quotation marks (') in this line. If your ISP’s SMTP server is at smtp.myisp.com, you would change the line to

```plaintext
define(`SMART_HOST', `smtp.myisp.com')dnl
```

Do not alter the back ticks (``) or the single quotation marks (')

**tip** Be careful not to alter the back ticks (``) or the single quotation marks (') in any line in `sendmail.mc`. These symbols control the way the `m4` preprocessor converts `sendmail.mc` to `sendmail.cf`; `sendmail` will not work properly if you do not preserve these symbols.

Restart `sendmail` so that it regenerates the `sendmail.cf` file from the `sendmail.mc` file you edited (page 742).

**Test** Test `sendmail` with the following command:

```plaintext
$ echo "my sendmail test" | /usr/sbin/sendmail user@remote.host
```

Replace `user@remote.host` with an email address on another system where you receive email. You need to send email to a remote system to make sure that `sendmail` is relaying your email.

---

**LPI** JUMPSTART II: CONFIGURING `sendmail` ON A SERVER

If you want to receive inbound email sent to a registered domain that you own, you need to set up `sendmail` as an incoming mail server. This JumpStart describes how to set up such a server. This server

- Accepts outbound email from the local system only.
- Delivers outbound email directly to the recipient’s system, without using an SMTP relay (smarthost).
- Accepts inbound email from any system.

This server does not relay outbound email originating on other systems. Refer to “access: Sets Up a Relay Host” on page 752 if you want the local system to act as a relay. For this configuration to work, you must be able to make outbound connections from and receive inbound connections to port 25.

The line in `sendmail.mc` that limits `sendmail` to accepting inbound email from the local system only is

```plaintext
DAEMON_OPTIONS(`Port=smtp, Addr=127.0.0.1, Name=MTA')dnl
```

To allow `sendmail` to accept inbound email from other systems, remove the parameter `Addr=127.0.0.1`, from the preceding line:

```plaintext
DAEMON_OPTIONS(`Port=smtp, Name=MTA')dnl
```
This book is used as the adopted text in many college classes. Because students who take these classes often seek LPI or CompTIA certification, instructors have asked for a mapping of certification objectives to the material covered in this book. This book fully covers LPI's Linux Essentials certification learning goals and provides extensive coverage of CompTIA's Linux+ exam objectives. This appendix maps these learning goals and exam objectives to pages in this book. The following icons are used throughout the book to mark the places where learning goals and exam objectives are discussed.

**LE** This icon indicates coverage of a topic in the LPI's Linux Essentials certification learning goals.

**LPI** This icon indicates coverage of a topic in the CompTIA's Linux+ exam objectives.

**LE+** This icon indicates coverage of a topic in the CompTIA's Linux+ exam objectives and a topic in the LPI's Linux Essentials certification learning goals.

**TOPIC 5: SECURITY AND FILE PERMISSIONS**

**5.1 BASIC SECURITY AND IDENTIFYING USER TYPES**

**DESCRIPTION:** VARIOUS TYPES OF USERS ON A LINUX SYSTEM

Key Knowledge Areas
Root and Standard Users
  ▶ Running Commands with root Privileges page 422
  ▶ The Special Powers of a Privileged User page 422
  ▶ Gaining root Privileges page 423
  ▶ Real UID Versus Effective UID page 425
System users
  ▶ /etc/passwd page 508

Partial List of Used Files, Terms, and Utilities
/etc/passwd, /etc/group
  ▶ /etc/passwd page 508
  ▶ /etc/group page 506
id, who, w
  ▶ id page 426
  ▶ who: Lists Users on the System page 254
  ▶ who, whoami page 426
  ▶ w: Lists Users on the System page 254
sudo
  ▶ Using sudo to Gain root Privileges page 428
Nice to Know

**su**
- Using `su` to gain `root` privileges page 425

### 5.2 Creating Users and Groups

**Description:** Creating users and groups on a Linux system

**Key Knowledge Areas**
- User and group commands
  - `useradd`: Adds a User Account page 600
  - `groupadd`: Adds a Group page 601
  - `usermod`: Modifies a User Account page 601
  - `userdel`: Removes a User Account page 600
  - `groupdel` and `groupmod`: Remove and Modify a Group page 601

**User IDs**
- Real UID Versus Effective UID page 425
- `/etc/passwd` page 508
- User ID page 1279 (Glossary)

**Partial List of Used Files, Terms, and Utilities**
- `/etc/passwd`, `/etc/shadow`, `/etc/group`
  - `/etc/passwd` page 508
  - `/etc/shadow` page 511
  - `/etc/group` page 506

**Nice to Know**
- `id`, `last`
  - `id` page 426
  - `last`: see the `last` man page
- `useradd`, `groupadd`
  - `useradd`: Adds a User Account page 600
  - `groupadd`: Adds a Group page 601
- `passwd`
  - Users: Changing Your Account Type and Password (GUI) page 112
  - `passwd`: Changing Your Password (CLI) page 137

### 5.3 Managing File Permissions and Ownership

**Description:** Understanding and manipulating file permissions and ownership settings

**Key Knowledge Areas**
- File/directory permissions and owners
  - Access Permissions page 191
Partial List of Used Files, Terms, and Utilities
ls –l
  ▶ ls –l: Displays Permissions page 191
chmod, chown
  ▶ chmod: Changes File Access Permissions page 193
  ▶ chmod: Makes a File Executable page 337
  ▶ chown: Changes File Ownership page 195
Nice to Know
chgrp
  ▶ chgrp: Changes File Group Association page 195

5.4 Special Directories and Files
Description: Special directories and files on a Linux system including special permissions
Key Knowledge Areas
System files, libraries
  ▶ Important Standard Directories and Files page 189
  ▶ library page 1258 (Glossary)
Symbolic links
  ▶ Symbolic Links page 206
  ▶ Symbolic links page 515
  ▶ symbolic link page 1276 (Glossary)
Partial List of Used Files, Terms, and Utilities
/etc, /var
  ▶ /etc page 190
  ▶ /etc page 506
  ▶ /var page 41
  ▶ /var page 191
/tmp, /var/tmp and Sticky Bit
  ▶ /tmp page 190
  ▶ /var page 191
  ▶ Sticky bit page 196
  ▶ sticky bit page 1275 (Glossary)
ls –d
  ▶ Directory page 221
ln –s
  ▶ Size page 222
Nice to Know
Hard links
  ▶ Hard Links page 204
Setuid/Setgid
  ▶ Setuid and Setgid Permissions page 196
  ▶ Setuid file page 424
Appendix E  LPI and CompTIA Certification

- Setuid files page 626
- setuid page 1272 (Glossary)
- setgid page 1272 (Glossary)

Certification Exam 1
Objectives: LX0-101

101 System Architecture

101.1 Determine and Configure Hardware Settings

Enable and disable integrated peripherals
Configure systems with or without external peripherals such as keyboards
Differentiate between the various types of mass storage devices
- /dev page 503
Set the correct hardware ID for different devices, especially the boot device
Know the differences between coldplug and hotplug devices
- Hotplug page 516

Determine hardware resources for devices
Tools and utilities to list various hardware information (e.g., lsusb, lspci, etc.)
- dmesg: Displays Kernel Messages page 595
- lspci: Lists PCI Information page 635
- lsblk: Lists Block Device Information page 635
- lshw: Lists Hardware Information page 636
- lsusb: Lists USB Devices page 636

Tools and utilities to manipulate USB devices
- Writing to a USB Flash Drive page 50

Conceptual understanding of sysfs, udev, hal, dbus
- udev page 516
- D-BUS page 898

Partial List of Used Files, Terms, and Utilities

/sys
- /sys page 190
- /sys page 514
- /sys page 516

/proc
- /proc page 190
- /proc page 512
- proc page 520

/dev
- Device file page 152
- /dev page 190
101.2 **Boot the System**

Provide common commands to the boot loader and options to the kernel at boot time
- Modifying Boot Parameters (Options) page 70
- GRUB: The Linux Boot Loader page 590

Demonstrate knowledge of the boot sequence from BIOS to boot completion
- BIOS setup page 31
- CMOS page 31
- Booting the System page 450
- GRUB: The Linux Boot Loader page 590
- BIOS page 590
- BIOS page 1239 (Glossary)

Check boot events in the log file
- dmesg: Displays Kernel Messages page 595

**Partial List of Used Files, Terms, and Utilities**

`/dev` page 503
- Device files page 515

```bash
modprobe
- modprobe page 589
lsmod
- lsmod page 589
lspci
- lspci: Lists PCI Information page 635
lsusb
- lsusb: Lists USB Devices page 636
```

`/var/log/messages`
- `/var/log/messages` page 514
- `/var/log/messages` page 622
- Log Files and Mail for root page 626
- `/var/log/messages` page 627

```bash
dmesg
- dmesg: Displays Kernel Messages page 595
```

**BIOS**
- BIOS setup page 31
- BIOS page 590
- BIOS page 1239 (Glossary)

**boot loader**
- GRUB: The Linux Boot Loader page 590

**kernel**
- Chapter 14: Building a Linux Kernel page 579
- kernel page 1257 (Glossary)

**init**
- init daemon page 374
101.3 Change Runlevels and Shutdown or Reboot System

Set the default runlevel
- Setting the Persistent Runlevel page 444
- /etc/inittab page 508

Change between runlevels including single-user mode
- Changing the Current Runlevel page 445
- telinit page 449
- Booting the System to Single-User/Rescue Mode page 450
- Going to Graphical Multiuser Mode page 452

Shutdown and reboot from the command line
- Bringing the System Down page 454

Alert users before switching runlevels or other major system events
 Properly terminate processes
- kill: Aborting a Background Job page 164
- kill: Sends a Signal to a Process page 465
- killall: Kills a Command page 467
- pkill: Kills a Command page 468
- kill: Aborts a Process page 1050

Partial List of Used Files, Terms, and Utilities

/ etc / inittab
- / etc / inittab page 508

shutdown
- Bringing the System Down page 454

init
- init daemon page 374
- The systemd init Daemon page 438
- SysVinit (rc) Scripts: Start and Stop System Services page 448
- systemd init daemon page 450

/etc/ init.d
- SysVinit (rc) Scripts: Start and Stop System Services page 448

telinit
- telinit page 449

102 Linux Installation and Package Management

102.1 Design Hard Disk Layout

Allocate filesystems and swap space to separate partitions or disks
- Setting Up the Hard Disk page 36
Tailor the design to the intended use of the system

- Planning the Installation page 29

Ensure the /boot partition conforms to the hardware architecture requirements for booting

- Where to put the /boot partition page 41
- LBA addressing mode and the /boot partition page 590

Partial List of Used Files, Terms, and Utilities

/ (root) filesystem
- / (root) page 40
- / (root) page 181
- / page 189
- root filesystem page 1271 (Glossary)

/var filesystem
- /var page 41
- /var page 191

/home filesystem
- /home page 41
- /home page 190

swap space
- (swap) page 40
- swap page 513
- swap space page 1276 (Glossary)

mount points
- Mount Points page 38
- Mount point page 521

partitions
- Partitions page 36
- Partition table page 36
- Primary, Extended, and Logical Partitions page 37
- Default Partitioning page 39
- Example minimum partition sizes page 42
- Manual/Custom Partitioning page 74
- partition page 1265 (Glossary)

102.2 Install a Boot Manager

Providing alternative boot locations and backup boot options

Install and configure a boot loader such as GRUB

- GRUB: The Linux Boot Loader page 590

Interact with the boot loader

- Booting the System to Single-User/Rescue Mode page 450

Partial List of Used Files, Terms, and Utilities

/boot/grub/menu.lst
- Configuring GRUB page 591
Appendix E LPI and CompTIA Certification

grub-install
  ☐ grub2-install: Installs the MBR and GRUB Files page 594

MBR
  ☐ Reinstalling the MBR page 456
  ☐ MBR page 590
  ☐ grub2-install: Installs the MBR and GRUB Files page 594

superblock
  ☐ superblock page 1276 (Glossary)

/etc/lilo.conf

lilo

102.3 Manage Shared Libraries

Identify shared libraries
  ☐ ldd page 487

Identify the typical locations of system libraries

Load shared libraries

Partial List of Used Files, Terms, and Utilities

ldd
  ☐ ldd & libwrap page 486
  ☐ ldd page 487

ldconfig

/etc/ld.so.conf

LD_LIBRARY_PATH

102.4 Use Debian Package Management

Install, upgrade, and uninstall Debian binary packages
  ☐ Using apt-get to Install, Remove, and Update Packages page 1184

Find packages containing specific files or libraries which may or may not be installed

Obtain package information like version, content, dependencies, package integrity, and installation status (whether or not the package is installed)

Partial List of Used Files, Terms, and Utilities

/etc/apt/sources.list
  ☐ sources.list: Specifies Repositories for apt-get to Search page 1187

dpkg
  ☐ apt-get and dpkg page 1184

dpkg-reconfigure

apt-get
  ☐ Using apt-get to Install, Remove, and Update Packages page 1184
  ☐ Using apt-get to Upgrade the System page 1185
  ☐ Other apt-get Commands page 1186
apt-cache
aptitude

102.5 Use RPM and YUM Package Management
See Chapter 12: Finding, Downloading, and Installing Software page 531

Install, re-install, upgrade, and remove packages using RPM and YUM
- JumpStart: Installing and Removing Software Packages Using yum page 534
- Updating Packages page 538
- RPM: The RPM Package Manager page 546
- Installing, Upgrading, and Removing Packages page 548
Obtain information on RPM packages such as version, status, dependencies, integrity, and signatures
- Querying Packages and Files page 547
Determine what files a package provides, as well as find which package a specific file comes from
- Finding the Package That Holds an Application or File You Need page 536
- Querying Packages and Files page 547

Partial List of Used Files, Terms, and Utilities
rpm
- RPM: The RPM Package Manager page 546
- Querying Packages and Files page 547
rpm2cpio
/etc/yum.conf
- yum.conf: Configures yum page 541
/etc/yum.repos.d/
- yum Repositories page 542
yum
- yum page 533
- JumpStart: Installing and Removing Software Packages Using yum page 534
- Finding the Package That Holds an Application or File You Need page 536
- yum: Keeps the System Up-to-Date page 538
yumdownloader
- Downloading RPM Package Files with yumdownloader page 540
- yumdownloader page 582

103 GNU and UNIX Commands

103.1 Work on the Command Line
See Chapter 5: The Shell page 141
See Chapter 9: The Bourne Again Shell (bash) page 327
See Chapter 7: The Linux Utilities page 215
See Chapter 27: Programming the Bourne Again Shell (bash) page 981
Appendix E  LPI and CompTIA Certification

Use single shell commands and one line command sequences to perform basic tasks on the command line
- Chapter 5: The Shell page 141
- Chapter 7: The Linux Utilities page 215
- Chapter 9: The Bourne Again Shell (bash) page 327

Use and modify the shell environment including defining, referencing, and exporting environment variables
- Parameters and Variables page 352
- Variables page 1031

Use and edit command history
- History page 376

Invoke commands inside and outside the defined path
- Absolute versus relative pathnames page 149
- PATH: Where the Shell Looks for Programs page 359

Partial List of Used Files, Terms, and Utilities
- . (dot)
  - . (Dot) or source: Runs a Startup File in the Current Shell page 332
  - exec versus . (dot) page 1045

bash
- Chapter 5: The Shell page 141
- Chapter 9: The Bourne Again Shell (bash) page 327
- Chapter 27: Programming the Bourne Again Shell (bash) page 981

echo
- echo: Displays Arguments page 219
- echo –e page 1009

env
- env: Runs a Program in a Modified Environment page 1035

eexec
- Opening a File Descriptor page 1017
- Duplicating a File Descriptor page 1017
- exec: Executes a Command or Redirects File Descriptors page 1045

export
- declare: Lists and Assigns Attributes to Variables page 357
- readonly and export page 357
- export: Puts Variables in the Environment page 1032

pwd
- pwd page 143

set
- set ±o: Turns Shell Features On and Off page 400
- set: Initializes Positional Parameters page 1024

unset
- unset: Removes a Variable page 356
man
  ▶ man: Displays the System Manual page 128
uname
  ▶ uname: Displays System Information page 470
history
  ▶ History page 376

103.2 Process Text Streams Using Filters
Send text files and output streams through text utility filters to modify the output using standard UNIX commands found in the GNU textutils package
  ▶ Redirection page 153
  ▶ Pipelines page 158
  ▶ Filters page 161

Partial List of Used Files, Terms, and Utilities

cat
  ▶ cat: Joins and Displays Files page 216
  ▶ cat page 152
  ▶ Redirection page 153

cut
  ▶ cut: Selects Characters or Fields from Input Lines page 225
expand
fmt
head
  ▶ head: Displays the Beginning of a File page 235
od
join
nl
paste
pr
sed
sort
  ▶ sort: Sorts and/or Merges Files page 239
split
tail
  ▶ tail: Displays the Last Part of a File page 241
tr
  ▶ tr page 159
  ▶ tr page 260
unexpand
uniq
wc

wc: Displays the Number of Lines, Words, and Bytes in Files page 244

103.3 PERFORM BASIC FILE MANAGEMENT
Copy, move, and remove files and directories individually
  • rmdir: Deletes a Directory page 186
  • mv, cp: Move or Copy Files page 187
  • mv: Moves a Directory page 188
  • rm: Removes a Link page 208
  • rm: Removes a File (Deletes a Link) page 222
  • cp: Copies Files page 224
  • mv: Renames or Moves a File page 237
Copy multiple files and directories recursively
  • cp: Copies Files page 224
Remove files and directories recursively
  • rm: Removes a File (Deletes a Link) page 222
Use simple and advanced wildcard specifications in commands
  • Filename Generation/Pathname Expansion page 165
  • Pathname Expansion page 412
Using find to locate and act on files based on type, size, or time
  • find: Finds Files Based on Criteria page 229
Usage of tar, cpio, and dd
  • tar: Stores or Extracts Files to/from an Archive File page 249
  • tar: Archives Files page 605
  • cpio: Archives Files page 605
Partial List of Used Files, Terms, and Utilities
  cp
    • mv, cp: Move or Copy Files page 187
    • cp: Copies Files page 224
  find
    • find: Finds Files Based on Criteria page 229
  mkdir
    • mkdir: Creates a Directory page 184
  mv
    • mv: Moves a Directory page 188
    • mv: Renames or Moves a File page 237
    • mv, cp: Move or Copy Files page 187
  ls
    • ls -l: Displays Permissions page 191
    • ls: Displays Information About Files page 221
Certification Exam 1 Objectives: LX0-101

**103.4 Use Streams, Pipes, and Redirects**

Redirecting standard input, standard output, and standard error
- Redirecting Standard Output page 154
- Redirecting Standard Input page 155
- Redirecting Standard Error page 333
- redirection page 1269 (Glossary)
- standard input page 1274 (Glossary)
- standard output page 1275 (Glossary)
- standard error page 1274 (Glossary)

Pipe the output of one command to the input of another command
- Pipelines page 158
- Filters page 161
- filter page 1250 (Glossary)
- pipeline page 1266 (Glossary)

Use the output of one command as arguments to another command
- xargs: Converts Standard Input to Command Lines page 260

Send output to both stdout and a file
- tee page 162
Partial List of Used Files, Terms, and Utilities

- tee
  - tee page 162
- xargs
  - xargs: Converts Standard Input to Command Lines page 260

103.5 Create, Monitor, and Kill Processes

Run jobs in the foreground and background
- Running a Command in the Background page 163
- Moving a Job from the Foreground to the Background page 164
- Background process page 375
  - background process page 1238 (Glossary)
  - foreground process page 1250 (Glossary)

Signal a program to continue running after logout

Monitor active processes
- Process Identification page 374
- ps page 374
- ps page 466

Select and sort processes for display
- Process Identification page 374
- ps page 466
- top: Lists Processes Using the Most Resources page 612

Send signals to processes
- Aborting Execution page 123
- kill: Aborting a Background Job page 164
- kill: Sends a Signal to a Process page 465
- killall: Kills a Command page 467
- pkill: Kills a Command page 468
- Signals page 1047

Partial List of Used Files, Terms, and Utilities

&
- Running a Command in the Background page 163
- Background process page 375
  - background process page 1238 (Glossary)
  - foreground process page 1250 (Glossary)
- bg
  - Moving a Job from the Foreground to the Background page 164
  - bg: Sends a Job to the Background page 348
  - background process page 1238 (Glossary)
- fg
  - Foreground page 163
  - Moving a Job from the Foreground to the Background page 164
  - fg: Brings a Job to the Foreground page 347
  - foreground process page 1250 (Glossary)
Certification Exam 1 Objectives: LX0-101

jobs
  • Determining the number of a job using jobs page 164
  • jobs: Lists Jobs page 346

kill
  • kill: Aborting a Background Job page 164
  • kill: Sends a Signal to a Process page 465

nohup

ps
  • Process Identification page 374
  • ps page 466

top
  • top: Lists Processes Using the Most Resources page 612

free
  • free: Displays Memory Usage Information page 253

uptime
  • uptime: Displays System Load and Duration Information page 253

killall
  • killall: Kills a Command page 467

103.6 Modify Process Execution Priorities
Know the default priority of a job that is created.
  • Process Identification page 374
  • ps page 466
  • top: Lists Processes Using the Most Resources page 612
Run a program with higher or lower priority than the default
Change the priority of a running process

Partial List of Used Files, Terms, and Utilities

nice

ps
  • Process Identification page 374
  • ps page 466

renice

top
  • top: Lists Processes Using the Most Resources page 612

103.7 Search Text Files Using Regular Expressions
See Appendix A: Regular Expressions page 1139
Create simple regular expressions containing several notational elements
  • Appendix A: Regular Expressions page 1139
  • Regular Expressions page 1101 (Python)
Use regular expression tools to perform searches through a filesystem or file content
  • See preceding entry.
Partial List of Used Files, Terms, and Utilities

grep
  - grep: Searches for a Pattern in Files page 232
egrep
  - Extended regular expression page 233
fgrep
sed
regex(7)

103.8 Perform Basic File Editing Operations Using vi

A Practical Guide to Fedora and Red Hat Enterprise Linux, Seventh Edition covers the vim editor. All commands discussed here are compatible between vi and vim.

Tutorial: Using vim to Create and Edit a File page 262

Navigate a document using vi
  - Moving the Cursor page 268

Use basic vi modes
  - Command and Input Modes page 264

Insert, edit, delete, copy, and find text
  - Entering Text page 265
  - Deleting Text page 268
  - Correcting Text page 268

Partial List of Used Files, Terms, and Utilities

vi
  - Tutorial: Using vim to Create and Edit a File page 262
/,, ?, h, j, k, l
  - Moving the Cursor page 268
i, o, a
  - Entering Text page 265
  - Entering Additional Text page 268
c, d, p, y, dd, yy
  - Deleting Text page 268
ZZ, :w!, :q!, :e!
  - Ending the Editing Session page 269

104 Devices, Linux Filesystems, Filesystem Hierarchy Standard

104.1 Create Partitions and Filesystems

Use various mkfs commands to set up partitions and create various filesystems such as:

ext2
  - ext2 page 519
  - ext2 to ext3 page 527
ext3
  ▶ ext3 page 519
  ▶ ext3 to ext2 page 527
xfs
  ▶ The XFS Filesystem page 527
reiserfs v3
  ▶ reiserfs page 520
vfat
  ▶ vfat page 520

Partial List of Used Files, Terms, and Utilities
fdisk
  ▶ fdisk: see the fdisk man page
  ▶ See also parted: Reports on and Partitions a Hard Disk page 614
mkfs
  ▶ mkfs: Creates a Filesystem page 467
mkswap
  ▶ swap page 513

104.2 Maintain the Integrity of Filesystems
Verify the integrity of filesystems
  ▶ fsck: Checks Filesystem Integrity page 525
Monitor free space and inodes
  ▶ df: shows where directory hierarchies are mounted page 804
Repair simple filesystem problems
  ▶ fsck: Checks Filesystem Integrity page 525

Partial List of Used Files, Terms, and Utilities
du
  ▶ du: Displays Disk Usage Information page 523
df
  ▶ df: shows where directory hierarchies are mounted page 804
fsck
  ▶ fsck: Checks Filesystem Integrity page 525
e2fsck
mke2fs
debugfs
dumpe2fs	
tune2fs
  ▶ tune2fs: Changes Filesystem Parameters page 526
xfs tools (such as xfs_metadump and xfs_info)
104.3 Control Mounting and Unmounting of Filesystems
Manually mount and unmount filesystems
- `mount`: Mounts a Filesystem page 520
- `umount`: Unmounts a Filesystem page 523
- `mount`: Mounts a Directory Hierarchy page 807
- Mounting Shares page 834
Configure filesystem mounting on bootup
- `fstab`: Keeps Track of Filesystems page 524
- `fstab` file page 807
- `/etc/fstab`: Mounts Directory Hierarchies Automatically page 811
Configure user mountable removable filesystems
- Mount Options page 522

Partial List of Used Files, Terms, and Utilities

/`etc/fstab`
- `fstab`: Keeps Track of Filesystems page 524
- `fstab` file page 807
- `/etc/fstab`: Mounts Directory Hierarchies Automatically page 811

/media
`mount`
- `mount`: Mounts a Filesystem page 520
- `mount`: Mounts a Directory Hierarchy page 807
- Mounting Shares page 834
`umount`
- `umount`: Unmounts a Filesystem page 523

104.4 Manage Disk Quotas
Set up a disk quota for a filesystem
- Disk Quota System page 629
Edit, check, and generate user quota reports
- `quota` and `repquota` page 629

Partial List of Used Files, Terms, and Utilities
`quota`
- `quota` and `repquota` page 629
`edquota`
- `edquota` and `quotaon` page 629
`repquota`
- `quota` and `repquota` page 629
`quotaon`
- `edquota` and `quotaon` page 629

104.5 Manage File Permissions and Ownership
Manage access permissions on regular and special files as well as directories
- `chmod`: Changes File Access Permissions page 193
CERTIFICATION EXAM 1 OBJECTIVES: LX0-101  1219

- chmod: Makes a File Executable page 337

Use access modes such as suid, sgid, and the sticky bit to maintain security
- Setuid and Setgid Permissions page 196
- Setuid file page 424
- Setuid files page 626
- setuid page 1272 (Glossary)
- setgid page 1272 (Glossary)

Know how to change the file creation mask
- umask: Specifies the File Permission Mask page 469

Use the group field to grant file access to group members
- ls -l: Displays Permissions page 191
- chmod: Changes File Access Permissions page 193
- /etc/group page 506

Partial List of Used Files, Terms, and Utilities

chmod
- chmod: Changes File Access Permissions page 193
- chmod: Makes a File Executable page 337

umask
- umask: Specifies the File Permission Mask page 469

chown
- chown: Changes File Ownership page 195

chgrp
- chgrp: Changes File Group Association page 195

104.6 CREATE AND CHANGE HARD AND SYMBOLIC LINKS

Create links
- ln: Creates a Hard Link page 204
- ln: Creates Symbolic Links page 207

Identify hard and/or softlinks
- ls and link counts page 206
- ls and inodes page 206
- hard link page 1252 (Glossary)
- link page 1258 (Glossary)
- symbolic link page 1276 (Glossary)

Copying versus linking files
- cp Versus ln page 205

Use links to support system administration tasks
- ln: Creates a Hard Link page 204
- ln: Creates Symbolic Links page 207

Partial List of Used Files, Terms, and Utilities

ln
- ln: Creates a Hard Link page 204
- ln: Creates Symbolic Links page 207
104.7 **Find System Files and Place Files in the Correct Location**

Understand the correct locations of files under the FHS
- Important Standard Directories and Files page 189
- Important Files and Directories page 502

Find files and commands on a Linux system
- `whereis` page 255
- `locate`: Searches for a File page 256

Know the location and purpose of important files and directories as defined in the FHS
- Important Standard Directories and Files page 189
- Important Files and Directories page 502

Partial List of Used Files, Terms, and Utilities
- `find`
  - `find`: Finds Files Based on Criteria page 229
- `locate`
  - `locate`: Searches for a File page 256
- `updatedb`
  - `updatedb` page 256
- `whereis`
  - `whereis` page 255
- `which`
  - `which` page 255
- `type`
  - `type`: Displays Information About a Command page 1041

/`etc/updatedb.conf`

---

**Certification Exam 2 Objectives: LX0-102**

**105 Shells, Scripting, and Data Management**

**105.1 Customize and Use the Shell Environment**

*See Chapter 9: The Bourne Again Shell (bash) page 327*

Set environment variables (e.g., `PATH`) at login or when spawning a new shell
- Startup Files page 329
- Set `PATH` in `.bash_profile` page 331
- Keyword variables page 353
- Keyword Variables page 358

Write bash functions for frequently used sequences of commands
- Functions page 396
- Variables in Functions page 1039
Maintain skeleton directories for new user accounts
  ➢ useradd: Adds a User Account page 600

Set command search path with the proper directory
  ➢ PATH: Where the Shell Looks for Programs page 359

Partial List of Used Files, Terms, and Utilities

/etc/profile
  ➢ /etc/profile page 330
  ➢ /etc/profile and /etc/profile.d page 509

env
  ➢ env: Runs a Program in a Modified Environment page 1035

export
  ➢ declare: Lists and Assigns Attributes to Variables page 357
  ➢ export: Puts Variables in the Environment page 1032

set
  ➢ set ±o: Turns Shell Features On and Off page 400
  ➢ set: Initializes Positional Parameters page 1024

unset
  ➢ unset: Removes a Variable page 356

~/.bash_profile
  ➢ .bash_profile, .bash_login, and .profile page 330
  ➢ ~/.bash_profile page 502

~/.bash_login
  ➢ .bash_profile, .bash_login, and .profile page 330

~/.profile
  ➢ .bash_profile, .bash_login, and .profile page 330

~/.bashrc
  ➢ .bashrc page 331
  ➢ ~/.bashrc page 502

~/.bash_logout
  ➢ .bash_logout page 330

functions
  ➢ Functions page 396
  ➢ Variables in Functions page 1039

alias
  ➢ Aliases page 392
  ➢ Alias Substitution page 404

lists
  ➢ Lists page 162

105.2 Customize or Write Simple Scripts

See Chapter 9: The Bourne Again Shell (bash) page 327

See Chapter 27: Programming the Bourne Again Shell (bash) page 981
1222  APPENDIX E  LPI AND COMP TIA CERTIFICATION

Use standard sh syntax (loops, tests)
  ▶ Control Structures page 982
Use command substitution
  ▶ Command Substitution page 410
Test return values for success or failure or other information provided by a command
  ▶ test builtin page 983
  ▶ [] is a synonym for test page 986
  ▶ test builtin page 1000
Perform conditional mailing to the superuser
Correctly select the script interpreter through the shebang (#!) line
  ▶ #! Specifies a Shell page 338
Manage the location, ownership, execution, and suid-rights of scripts
  ▶ Listing setuid files page 458
Partial List of Used Files, Terms, and Utilities
  ▶ for...in page 995
  ▶ for page 997
  ▶ while page 999
  ▶ test builtin page 983
  ▶ [] is a synonym for test page 986
  ▶ test builtin page 1000
  ▶ if...then page 983
  ▶ if...then...else page 987
  ▶ if...then...elif page 989
read
  ▶ read: Accepts User Input page 1041
seq
  ▶ seq page 407

105.3 SQL DATA MANAGEMENT
See Chapter 29: The MariaDB SQL Database Management System page 1113
Use of basic SQL commands
  ▶ Notes page 1114
Perform basic data manipulation
  ▶ Examples page 1123
Partial List of Used Files, Terms, and Utilities
  ▶ INSERT INTO page 1125
update
  ▪ UPDATE page 1128

select
  ▪ Retrieving Data page 1126
  ▪ Joins page 1130

delete
  ▪ DELETE FROM page 1128

from
  ▪ DELETE FROM page 1128

where
  ▪ WHERE page 1127

group by

order by
  ▪ ORDER BY page 1126

join
  ▪ Joins page 1130

106 USER INTERFACES AND DESKTOPS

106.1 INSTALL AND CONFIGURE X11

See X Window System page 459

Verify that the video card and monitor are supported by an X server
  ▪ Displays page 109

Awareness of the X font server

Basic understanding and knowledge of the X Window configuration file

Partial List of Used Files, Terms, and Utilities

/etc/X11/xorg.conf

xhost
  ▪ xhost Grants Access to a Display page 461

DISPLAY
  ▪ The DISPLAY Variable page 462

xwininfo

xdpyinfo

X
  ▪ X Window System page 459
106.2 Set Up a Display Manager

- Turn the display manager on or off
- Change the display manager greeting
- Change default color depth for the display manager
- Configure display managers for use by X-stations

Partial List of Used Files, Terms, and Utilities
/etc/inittab
  - /etc/inittab page 508
xdm configuration files
kdm configuration files
gdm configuration files
  - Graphical login page 453
  - The Xorg –nolisten tcp Option page 460

106.3 Accessibility

- Keyboard Accessibility Settings (AccessX?)
- Visual Settings and Themes
- Assistive Technology (ATs)

Partial List of Used Files, Terms, and Utilities
Sticky/Repeat Keys
Slow/Bounce/Toggle Keys
Mouse Keys
High Contrast/Large Print Desktop Themes
Screen Reader
Braille Display
Screen Magnifier
On-Screen Keyboard
Gestures (used at login, for example gdm)
Orca
GOK
emacspeak

107 Administrative Tasks

107.1 Manage User and Group Accounts and Related System Files

- Add, modify, and remove users and groups
  - system-config-users: Manages User Accounts page 598
  - Managing User Accounts from the Command Line page 600
- Manage user/group info in password/group databases
  - Modifying a User page 600
  - Working with Groups page 600
Certification Exam 2 Objectives: LX0-102

1225

- `usermod`: Modifies a User Account page 601
- `groupdel` and `groupmod`: Remove and Modify a Group page 601
- `chage`: page 601

Create and manage special purpose and limited accounts

Partial List of Used Files, Terms, and Utilities

/`etc/passwd`
  - `/etc/passwd` page 508

/`etc/shadow`
  - `/etc/shadow` page 511

/`etc/group`
  - `/etc/group` page 506

/`etc/skel`
  - `/etc/skel` page 600

`chage`
  - `chage` page 601

`groupadd`
  - `groupadd`: Adds a Group page 601

`groupdel`
  - `groupdel` and `groupmod`: Remove and Modify a Group page 601

`groupmod`
  - `groupdel` and `groupmod`: Remove and Modify a Group page 601

`passwd`
  - Users: Changing Your Account Type and Password (GUI) page 112
  - `passwd`: Changing Your Password (CLI) page 137

`useradd`
  - `useradd`: Adds a User Account page 600

`userdel`
  - `userdel`: Removes a User Account page 600

`usermod`
  - `usermod`: Modifies a User Account page 601

107.2 Automate System Administration Tasks by Scheduling Jobs

Manage `cron` and at jobs
- `crond` and `anacron`: Schedule Routine Tasks page 607
- `at`: Runs Occasional Tasks page 611

Configure user access to `cron` and at services
- `/etc/at.allow`, `/etc/at.deny`, `/etc/cron.allow`, and `/etc/cron.deny` page 506

Partial List of Used Files, Terms, and Utilities

/`etc/cron.{d,daily,monthly,weekly}`
  - Crontab Files page 607

/`etc/allow`
  - `/etc/at.allow`, `/etc/at.deny`, `/etc/cron.allow`, and `/etc/cron.deny` page 506
Appendix E  LPI and CompTIA Certification

/etc/at.allow
  » /etc/at.allow, /etc/at.deny, /etc/cron.allow, and /etc/cron.deny page 506
/etc/crontab
  » /etc/crontab page 608
/etc/cron.allow
  » /etc/at.allow, /etc/at.deny, /etc/cron.allow, and /etc/cron.deny page 506
/etc/cron.deny
  » /etc/at.allow, /etc/at.deny, /etc/cron.allow, and /etc/cron.deny page 506

  » Crontab Files page 607
crontab
  » User crontab files page 608
cron and anacron: Schedule Routine Tasks page 607
at
  » at: Runs Occasional Tasks page 611
atq
atrm

107.3 Localization and Internationalization
Locale settings
  » Locale page 368
  » locale page 1258 (Glossary)
Time zone settings
  » tzconfig page 372
  » tzselect page 372
  » /etc/timezone page 372
Partial List of Used Files, Terms, and Utilities
/etc/timezone
  » /etc/timezone page 372
/etc/localtime
  » /etc/localtime page 373
/usr/share/zoneinfo
  » /usr/share/zoneinfo page 372
Environment variables:
  » LC_: Locale Variables page 368
  » Environment Variables page 1032
/usr/bin/locale
  » locale: Displays Locale Information page 369
tzselect
  » tzselect page 372
tzconfig
  » tzconfig page 372
date
  ▪ date: Displays the System Time and Date page 218
iconv
UTF-8
  ▪ LC_: Locale Variables page 368
  ▪ UTF-8 page 1279 (Glossary)
ISO-8859
  ▪ LC_: Locale Variables page 368
ASCII
  ▪ ASCII page 1237 (Glossary)
Unicode
  ▪ Unicode page 1279 (Glossary)

108 ESSENTIAL SYSTEM SERVICES

108.1 MAINTAIN SYSTEM TIME
Set the system date and time
  ▪ timedatectl: Reports on and Sets the System Clock page 613
Set the hardware clock to the correct time in UTC
Configure the correct time zone
  ▪ Time page 371
Basic NTP configuration
Knowledge of using the pool.ntp.org service
Partial List of Used Files, Terms, and Utilities
/usr/share/zoneinfo
  ▪ /usr/share/zoneinfo page 372
/etc/timezone
  ▪ /etc/timezone page 372
/etc/localtime
  ▪ /etc/localtime page 373
/etc/ntp.conf
date
  ▪ date: Displays the System Time and Date page 218
  ▪ timedatectl: Reports on and Sets the System Clock page 613
hwclock
ntpd
ntpdate
pool.ntp.org

108.2 SYSTEM LOGGING
Syslog configuration files
  ▪ rsyslog.conf page 620
Appendix E  LPI and CompTIA Certification

syslog
  » rsyslogd: Logs System Messages page 620
standard facilities, priorities, and actions
  » Selectors page 620
  » Facilities page 620
  » Priorities page 620
  » Actions page 621

Partial List of Used Files, Terms, and Utilities
syslog.conf
  » rsyslog.conf page 620
syslogd
  » rsyslogd: Logs System Messages page 620
klogd
logger

108.3 Mail Transfer Agent (MTA) Basics

See Chapter 20: sendmail: Setting Up Mail Servers, Clients, and More page 739

Create e-mail aliases
  » /etc/aliases page 746

Configure e-mail forwarding
  » ~/.forward page 747

Knowledge of commonly available MTA programs (Postfix, sendmail, Qmail, exim) (no configuration)
  » Alternatives to sendmail page 741

Partial List of Used Files, Terms, and Utilities
~/.forward
  » ~/.forward page 747
sendmail emulation layer commands
newaliases
  » newaliases page 747
mail
mailq
  » mailq page 748
Postfix
  » Postfix page 742
sendmail
  » Introduction to sendmail page 740
  » Setting Up a sendmail Mail Server page 742
  » JumpStart I: Configuring sendmail on a Client page 743
  » JumpStart II: Configuring sendmail on a Server page 744
  » Working with sendmail Messages page 745
  » Configuring sendmail page 748
108.4 Manage Printers and Printing

See Chapter 13: Printing with CUPS page 555

Basic CUPS configuration (for local and remote printers)
- The System Configures a Local Printer Automatically page 558
- JumpStart I: Configuring a Printer Using system-config-printer page 558
- JumpStart II: Setting Up a Local or Remote Printer page 560
- Working with the CUPS Web Interface page 565
- Configuring Printers page 566

Manage user print queues
- Managing Print Queues page 572

Troubleshoot general printing problems

Add and remove jobs from configured printer queues
- BSD and System V command-line print utilities page 574

Partial List of Used Files, Terms, and Utilities

CUPS configuration files, tools, and utilities
- JumpStart I: Configuring a Printer Using system-config-printer page 558
- Working with the CUPS Web Interface page 565
- Sharing CUPS Printers page 572

/etc/cups
- Example lpadmin Commands page 570

lpd legacy interface (lpr, lprm, lpq)
- Traditional UNIX Printing page 573

109 Networking Fundamentals

See Chapter 8: Networking and the Internet page 279

109.1 Fundamentals of Internet Protocols

See Network Protocols page 290

Demonstrate an understanding of network masks
- Subnet mask page 298
- network mask page 1263 (Glossary)

Knowledge of the differences between private and public “dotted quad” IP Addresses
- Private address space page 637
- private address space page 1267 (Glossary)
Setting a default route
Knowledge about common TCP and UDP ports (20, 21, 22, 23, 25, 53, 80, 110, 119, 139, 143, 161, 443, 465, 993, 995)
  ◦ Each chapter covering a server discusses which ports that server uses.
  ◦ Ports page 312
  ◦ port page 1266 (Glossary)
Knowledge about the differences and major features of UDP, TCP, and ICMP
  ◦ UDP page 290
  ◦ UDP: User Datagram Protocol page 292
  ◦ TCP page 290
  ◦ TCP: Transmission Control Protocol page 291
  ◦ ping: Tests a Network Connection page 305
  ◦ UDP page 1278 (Glossary)
  ◦ TCP page 1276 (Glossary)
  ◦ ICMP page 1254 (Glossary)
Knowledge of the major differences between IPv4 and IPv6
  ◦ IPv4 page 292
  ◦ IPv6 page 293
Partial List of Used Files, Terms, and Utilities
/etc/services
  ◦ Network Services page 313
  ◦ /etc/services page 511
ftp
  ◦ Chapter 19: FTP: Transferring Files Across a Network page 713
telnet
  ◦ telnet: Logs In on a Remote System page 303
host
  ◦ host and dig: Query Internet Nameservers page 307
ping
  ◦ ping: Tests a Network Connection page 305
dig
  ◦ host and dig: Query Internet Nameservers page 307
  ◦ dig page 861
  ◦ dig page 862
traceroute
  ◦ traceroute: Traces a Route over the Internet page 306
tracepath

109.2 Basic Network Configuration
Manually and automatically configure network interfaces
  ◦ Configuring the Systems page 636
  ◦ NetworkManager: Configures Network Connections page 637
Basic TCP/IP host configuration

Partial List of Used Files, Terms, and Utilities
/etc/hostname
  › /etc/hostname page 507
/etc/hosts
  › Hostnames page 300
  › /etc/hosts page 507
/etc/resolv.conf
  › /etc/resolv.conf page 510
/etc/nsswitch.conf
  › nsswitch.conf: Which Service to Look at First page 495
ifconfig
ifup
ifdown
route
ping
  › ping: Tests a Network Connection page 305

**109.3 BASIC NETWORK TROUBLESHOOTING**
Manually and automatically configure network interfaces and routing tables to include adding, starting, stopping, restarting, deleting, or reconfiguring network interfaces
Change, view, or configure the routing table and correct an improperly set default route manually
Debug problems associated with the network configuration

Partial List of Used Files, Terms, and Utilities
ifconfig
ifup
ifdown
route
host
  › host and dig: Query Internet Nameservers page 307
hostname
  › hostname: Displays the System Name page 219
  › /etc/sysconfig/network page 511
dig
  › host and dig: Query Internet Nameservers page 307
  › dig page 861
  › dig page 862
netstat
ping
  › ping: Tests a Network Connection page 305
Appendix E  LPI and CompTIA Certification

traceroute
  traceroute: Traces a Route over the Internet page 306

109.4 Configure Client Side DNS
See Chapter 24: DNS/BIND: Tracking Domain Names and Addresses page 851
Demonstrate the use of DNS on the local system
  JumpStart I: Setting Up a DNS Cache page 866
Modify the order in which name resolution is done
  Resolver page 854
Partial List of Used Files, Terms, and Utilities
/etc/hosts
  Hostnames page 300
  /etc/hosts page 507
/etc/resolv.conf
  /etc/resolv.conf page 510
/etc/nsswitch.conf
  nsswitch.conf: Which Service to Look at First page 495

110 Security

110.1 Perform Security Administration Tasks
Audit a system to find files with the suid/sgid bit set
  Listing setuid files page 458
  Listing setgid files page 459
Set or change user passwords and password aging information
  Users: Changing Your Account Type and Password (GUI) page 112
  passwd: Changing Your Password (CLI) page 137
  Modifying a User page 600
  chage page 601
Being able to use nmap and netstat to discover open ports on a system
Set up limits on user logins, processes, and memory usage
Basic sudo configuration and usage
  Using sudo to Gain root Privileges page 428
Partial List of Used Files, Terms, and Utilities
find
  find: Finds Files Based on Criteria page 229
passwd
  Users: Changing Your Account Type and Password (GUI) page 112
  passwd: Changing Your Password (CLI) page 137
lsol
  lsol: Finds Open Files page 624
nmap
chage
  - chage page 601
netstat
sudo
  - Using sudo to Gain root Privileges page 428
/etc/sudoers
  - sudoers: Configuring sudo page 433
su
  - Using su to Gain root Privileges page 425
usermod
  - usermod: Modifies a User Account page 601
ulimit

110.2 SET UP HOST SECURITY
Awareness of shadow passwords and how they work
  - /etc/shadow page 511
Turn off network services not in use
  - Configuring Daemons (Services) page 445
    - service page 443
    - chkconfig and service page 445
    - system-config-services: Configures Services page 447
Understand the role of TCP wrappers
  - TCP Wrappers: Secure a Server (hosts.allow and hosts.deny) page 485
Partial List of Used Files, Terms, and Utilities
/etc/nologin
  - Going to Single-User Mode page 434
/etc/passwd
  - /etc/passwd page 508
/etc/shadow
  - /etc/shadow page 511
/etc/xinetd.d/* [deprecated]
/etc/xinetd.conf [deprecated]
/etc/inetd.d/* [deprecated]
/etc/inetd.conf [deprecated]
/etc/inittab
  - /etc/inittab page 508
/etc/init.d/*
  - SysVinit (rc) Scripts: Start and Stop System Services page 448
/etc/hosts.allow
  - hosts.allow and hosts.deny page 486
Appendix E  LPI and CompTIA Certification

/etc/hosts.deny
  • hosts.allow and hosts.deny page 486

110.3 Securing Data with Encryption
Perform basic OpenSSH 2 client configuration and usage
  • Configuring OpenSSH Clients page 690
  • Running the ssh, scp, and sftp OpenSSH Clients page 689
Understand the role of OpenSSH 2 server host keys
  • How OpenSSH Works page 687
  • Authorized Keys: Automatic Login page 700
Perform basic GnuPG configuration and usage
  • Tutorial: Using GPG to Secure a File page 1169
Understand SSH port tunnels (including X11 tunnels)
  • Tunneling/Port Forwarding page 707

Partial List of Used Files, Terms, and Utilities

ssh
  • ssh: Logs in or Executes Commands on a Remote System page 693
  • ssh-keygen page 701
ssh-agent
  • ssh-agent: Holds Your Private Keys page 703
ssh-add
  • ssh-add page 703
~/.ssh/id_rsa and id_rsa.pub
  • id_rsa id_rsa.pub page 689
  • id_rsa and id_rsa.pub page 701
~/.ssh/id_dsa and id_dsa.pub
  • id_dsa id_dsa.pub page 689
/etc/ssh/ssh_host_rsa_key and ssh_host_rsa_key.pub
  • ssh_host_rsa_key, ssh_host_rsa_key.pub page 688
/etc/ssh/ssh_host_dsa_key and ssh_host_dsa_key.pub
  • ssh_host_dsa_key, ssh_host_dsa_key.pub page 688
~/.ssh/authorized_keys
  • authorized_keys page 688
/etc/ssh_known_hosts
  • ssh_known_hosts page 692

gpg
  • GnuPG/PGP page 1160
  • Tutorial: Using GPG to Secure a File page 1169
~/.gnupg/*
  • ~/.gnupg page 1170
