The Future According to Bill 253

The Future According to John 255

Index 257

About the Authors

John Biehler has been writing online about technology since 1999. An avid photographer and generally curious geek, he discovered 3D printing a number of years ago and built his first 3D printer shortly thereafter. Since then, he has been actively sharing his knowledge about the technology with thousands of people at various events and conferences in Western Canada and the Pacific Northwest, on television and radio, as well as online through his website. He cofounded a Vancouver-area group of 3D printer builders and enthusiasts that has grown exponentially since it started and as the technology heads toward the mainstream.

Bill Fane was a product engineer and then product engineering manager for Weiser Lock in Vancouver, British Columbia, for 27 years and holds 12 U.S. patents. He has been using AutoCAD for design work since Version 2.17g (1986) and Inventor since version 1.0 beta (1996). He is a retired Professional Engineer and an Autodesk Authorized Training Centre (ATC) certified instructor. He began teaching mechanical design in 1996 at the British Columbia Institute of Technology (BCIT) in Vancouver, including such courses as AutoCAD, Mechanical Desktop, Inventor, SolidWorks, machine design, term projects, manufacturing processes, and design procedures. He retired from this position in 2008. He has lectured on a wide range of AutoCAD and Inventor subjects at Autodesk University since 1995 and at Destination Desktop since 2003. He was the AUGI CAD Camp National Team instructor for the manufacturing track. He has written more than 220 “The Learning Curve” AutoCAD tutorial columns for *CADalyst* magazine since 1986. He is the current author of the book *AutoCAD for Dummies*. He also writes software product reviews for *CADalyst*, *Design Product News*, and *Machine Design*. He is an active member of the Vancouver AutoCAD Users Society, “the world’s oldest and most dangerous.” In his spare time he skis, water skis, windsurfs, scuba dives, sails a Hobie Cat, rides an off-road motorcycle, drives his ’37 Rolls Royce limousine or his wife’s ’89 Bentley Turbo R, travels extensively with his wife, and plays with his grandchildren.

Dedication

John Biehler: I want to dedicate this book to Kelli Smith, who watched patiently as I built my first 3D printer on my dining room table and has supported my efforts in 3D printing ever since my first printed object came off the printer.

Bill Fane: To my wife Bev, who still manages to tolerate me after being married for 48 years.

Acknowledgments

John Biehler: I want to acknowledge and thank friends and members of 3D604.org, the Vancouver Hackspace, and Metrix Create:Space in Seattle. Without their help, friendship, and willingness to share their knowledge, my participation in this book would not have been possible.

We Want to Hear from You!

As the reader of this book, *you* are our most important critic and commentator. We value your opinion and want to know what we're doing right, what we could do better, what areas you'd like to see us publish in, and any other words of wisdom you're willing to pass our way.

We welcome your comments. You can email or write to let us know what you did or didn't like about this book—as well as what we can do to make our books better.

Please note that we cannot help you with technical problems related to the topic of this book.

When you write, please be sure to include this book's title and author as well as your name and email address. We will carefully review your comments and share them with the author and editors who worked on the book.

Email: feedback@quepublishing.com

Creating 3D Objects with Cameras and 123D Catch

Autodesk has a free service called 123D Catch that allows you to scan objects in 3D of just about anything, including people or buildings, using a regular digital camera—even with the one in your smartphone or tablet.

NOTE

You will need to set up an Autodesk account (it's free) before you can start. The process is quick and only requires a valid email address. It can be done via the application directly or via the website at <http://123dapp.com>.

There are a couple of ways to use 123D Catch. In this chapter, we cover the use of the iOS and web versions of the software. Both require that you take multiple photos of your object, from every angle possible. Then you submit those photos to the 123D servers either from within the Apple iOS app or via your browser.

NOTE

123D Catch is not currently available for Android devices but works with any mobile iOS device from Apple that has a camera such as an iPhone, iPad (see Figure 4.1), or iPod Touch.

The 123D website then processes those images and presents you a 3D model of the object. We go over some tips to ensure the best possible success in capturing your model.

FIGURE 4.1 Launching 123D Catch application on iPad.

NOTE

123D Catch doesn't require the use of an Apple device. You can use any camera and upload the photos using the website version of the application. The same tips apply when using your own camera. The iOS app just saves you the step of having to manually upload the photos.

Photographing Objects

Let's start with a handmade ceramic cactus that was purchased at a street market in Mexico about 20 years ago. The scanning process works best with objects that aren't shiny because reflections can cause problems while processing the model.

TIP

If you have an object with a shiny or reflective surface, you can apply something such as cornstarch, flour, or a similar powder to make that surface less reflective. The same applies if you are scanning people. Dark hair doesn't register as well as lighter hair. Applying a white powder (such as cornstarch) to dark hair will assist in bringing out the details in the model when scanning.

Using an iPad and the 123D Catch app, approximately 30 photos of the cactus were taken from every angle of it (see Figure 4.2).

NOTE

The 123D Catch app is free from the Apple App Store. Visit <http://123Dapp.com/> for more information.

FIGURE 4.2 Using an iPad to photograph the cactus.

Start at one side of the object, and work your way around it, keeping the object fully in the frame, approximately the same distance for each photo. Alternatively, you can set up your camera in a fixed position and rotate the object you're photographing. It's better to have some overlap of the object in each photo than not because the software will figure out where to stitch the images together better.

TIP

Ideally, the background in the photos should be high contrast or complex compared to your object. Scanning a solid red object on a red table for example will lead to a poor scan. Simply using a sheet of (black-and-white) newspaper underneath your object can greatly improve your scanning results. This contrast helps the software separate your object from the background in the photos.

You can review what you've captured by pressing the Review button, as shown in Figure 4.3. You can delete images or retake specific angles if they didn't turn out simply by tapping on the photo.

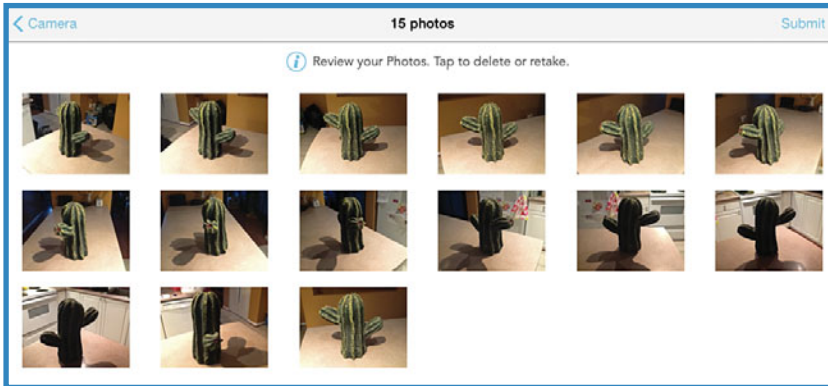

FIGURE 4.3 Gallery of captured images for review.

If you touch the screen on the iPad with one finger, you can rotate the model. Using two fingers at the same time, you can pinch and zoom to adjust your view of the model. The model also can appear upside-down depending on the orientation of the camera used to capture it.

When you're happy with the results, press the Finish Capture button, which takes you back to the Captures tab. Press the Tap to Process button to begin the process of uploading the photos to the Autodesk servers and begin converting the images into your 3D model.

NOTE

This process can vary in length depending on how busy the servers are and how complex your model is, but it usually takes only a few minutes.

When the software finished processing the model, it gave me the 3D model of the cactus (see Figure 4.4).

FIGURE 4.4 Reviewing the 3D model output from 123D Catch on the iPad.

FIGURE 4.5 Overhead view of 3D model.

Correcting the Model

There are a few issues with the model that need to be corrected; we walk through them here. You'll notice that the top of the surface on which your object was sitting may also be included in the model. Shortly, we'll go through the steps to trim that off, leaving only the desired object behind as your 3D model.

After saving the model to your Autodesk account, you then can manipulate it further using the other Autodesk applications. We cover these in later chapters. Your model should appear in the Captures tab of 123D Catch on the iPad and in the My Projects section online after you log in to 123D Catch (see Figure 4.6).

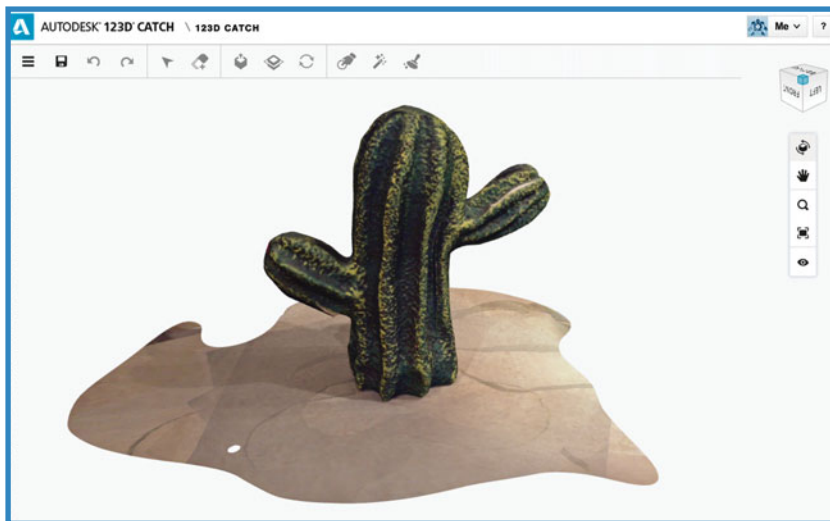

FIGURE 4.6 Reviewing the finished output 3D model of the cactus in the online version of 123D Catch.

As mentioned, the bottom of the model contains the surface on which the object was sitting when you captured the images. We're going to use the Plane Cut tool to trim off the bottom of the model, leaving behind only the cactus object, as shown in Figure 4.7.

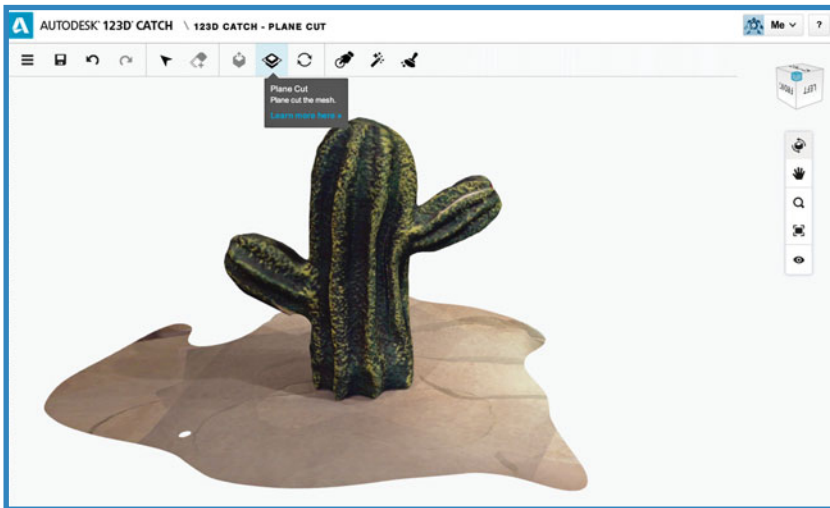

FIGURE 4.7 Plane Cut tool.

Select the Plane Cut tool from the toolbar. A set of controls should appear on your model with an arrow pointing along the Z axis. The bottom of this arrow represents the bottom of the model and direction the cut will occur. A circular control on both the X and Y axis lets you rotate the cutting surface and align it with the bottom of your model.

In Figure 4.8, the arrow is pointing down. It should be pointing up; otherwise the top of the cactus would get cut off. Click and drag your mouse on either the X or Y circle (below the purple line in Figure 4.8) to rotate the cut line. It should snap at the 45° and 90° positions to help with alignment.

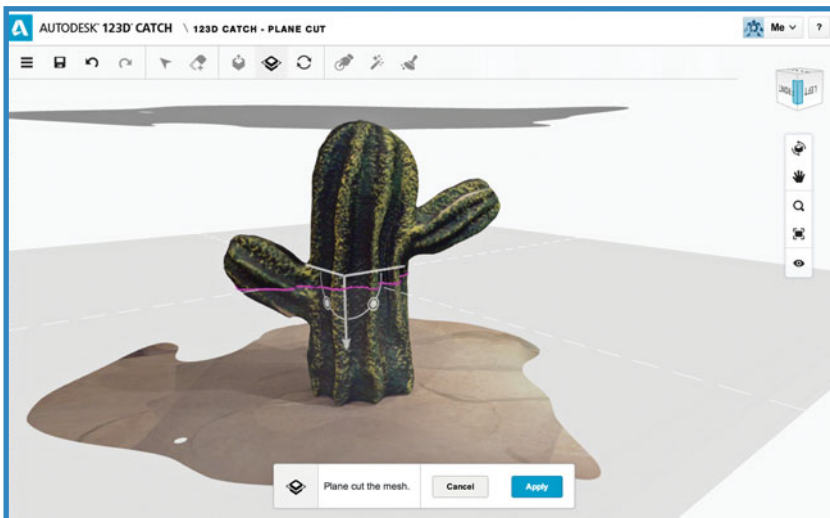

FIGURE 4.8 Ensure the arrow is pointing in the correct direction of the desired cut.

When the arrow is orientated correctly, you can then click and drag it to move the cutting plane up and down your model (see Figure 4.9). In this example, you want to see only the purple line along the bottom of the cactus which means that the cut will discard the countertop surface.

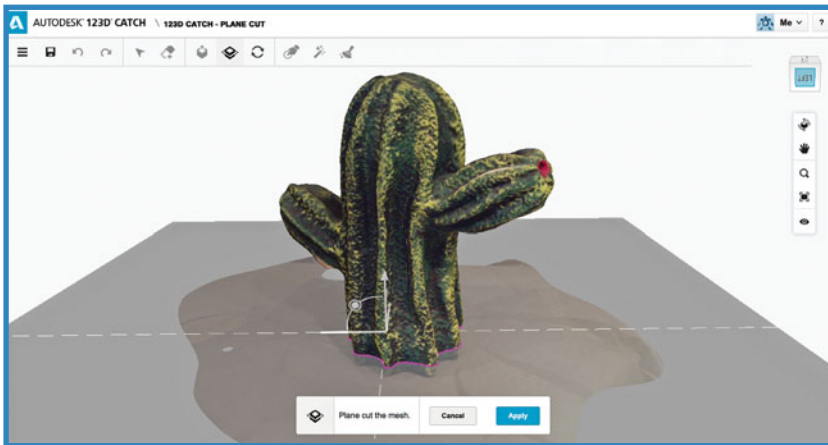

FIGURE 4.9 Moving the cutting plane.

Use the X- and Y-axis circles again to pivot the model along the plane until it's level. The purple line represents the new bottom of the model. Press the Apply button when you're happy with the position of the purple cutting line.

In Figure 4.10, you can see that the bottom of the model has been cut and the countertop surface has been removed from the model.

FIGURE 4.10 Cutting complete.

Orienting the Model

One last thing that you might need to do is orient the model so that it is upright for printing. You'll notice in Figure 4.11 that in the upper-right corner of the screen the orientation box is upside-down.

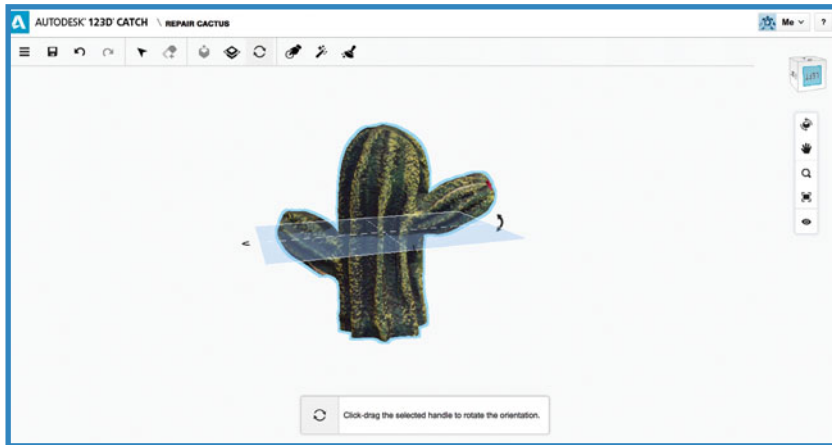

FIGURE 4.11 Orienting the model.

To correct this, press the Orientate button from the menu; a blue plane appears on the model. Clicking the arrow enables you to rotate the model and correct the orientation (see Figure 4.12). In this example you need to rotate the model 180°.

FIGURE 4.12 Model orientated correctly.

Note that the upper-right box is now upright. You'll need to save the model before you proceed to the next and final steps of repairing the model.

Repairing the Model

It's not uncommon for scans to result in some holes or rough spots due to the software misinterpreting your source photos. This can be caused by a number of reasons, but usually it's due to areas of the source object being in shadow or too similar to surrounding areas.

Fortunately, 123D Catch has some repair options included that will analyze the finished model. You can manually do some spot repairs to the model using the Smooth tool for rough areas and holes. Automatic repairs can be done using the Heal Mesh and Auto-Cleanup tools from the menu.

The Smooth tool is used to smooth out any rough points in the model that might not have been processed as accurately as desired. You can adjust the brush size using the slider on the bottom as well as the strength of the effect.

Start with small brush Size and low Strength; then work your way up (see Figure 4.13). You don't want to apply too strong of an effect because it will look obvious on the model. Also, be sure you rotate around the model to smooth all sides of the model.

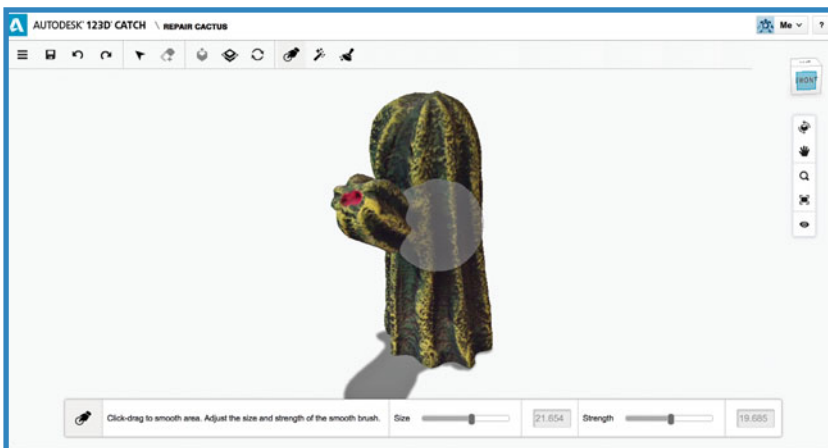

FIGURE 4.13 Smoothing the model.

The Heal Mesh tool detects any holes in the model and repairs them. Inspect the model after applying this to ensure it doesn't close openings that you intended to be open (see Figure 4.14).

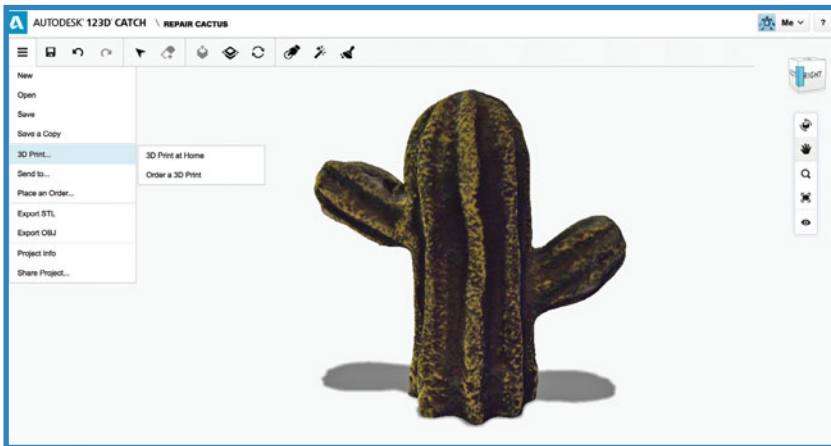

FIGURE 4.14 Getting ready to 3D print the model.

The Auto-Cleanup option magically fixes the model and removes any of the detached parts of the object. This is the last step you should apply. Again, inspect the model from all sides to ensure it didn't over-repair any parts of the model unnecessarily. Use the Undo option if you aren't happy with the results.

Finally, you can choose to preview the model for your 3D printer software or send it to a printing service (see Figure 4.15).

→ *For more information on how to send your model to a 3D printing service, go to Chapter 16, “Using a Third-Party 3D Printing Service Bureau.”*

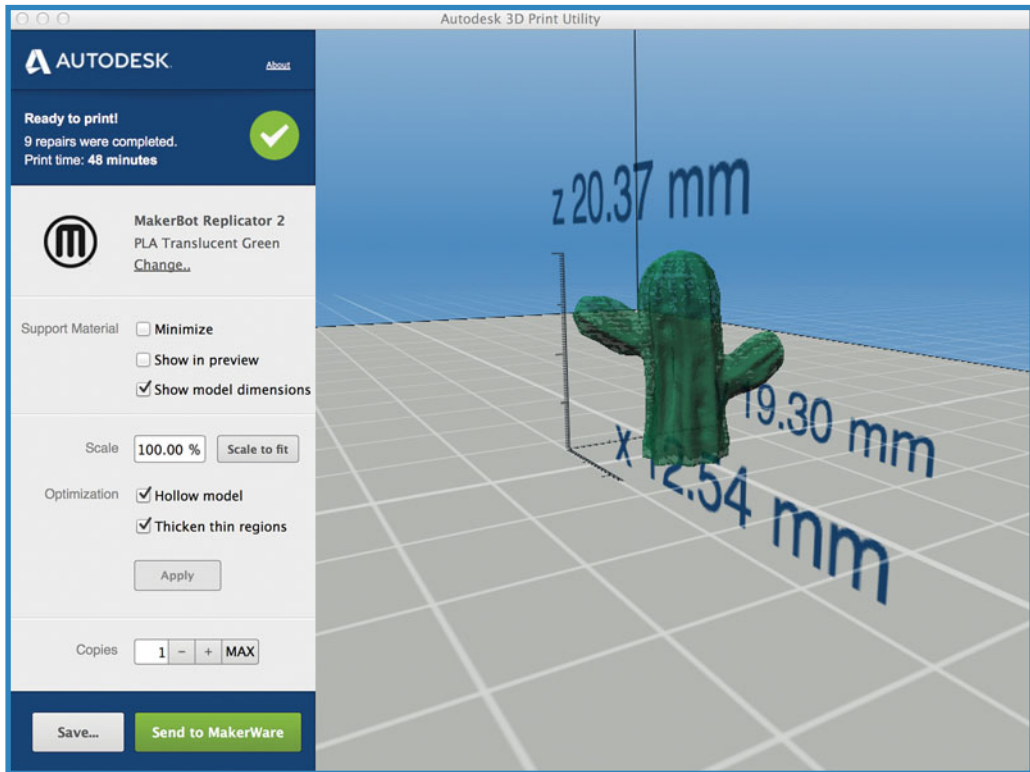

FIGURE 4.15 Autodesk Print Utility preview of the finished model for printing on a MakerBot.

Summary

In this chapter, we used an iPad to photograph a physical object and create a 3D model from those photographs. Then, using a number of built-in tools, we cleaned up and repaired the model, getting it ready to send to a 3D printer.

In the next chapter, we dive into creating models from scratch using your iPad and 123D Design.
