

# 2 Animating the Page

## **IN THIS CHAPTER**

- Timelines and Frames
- Movement Tweening
- Shape Tweening
- Fading
- Recap
- Advanced Projects

*You have totally re-created the Shelley Biotech homepage graphics with Flash. Now comes the fun part: animating it!*

*In this chapter you will learn the basic concepts you need to create animation in Flash movies. You will gain an understanding of what an animation is, the difference between the speed and the length of your animation, and what interface elements the Flash editor contains to help you create and control your animation.*

## **◆ Timelines and Frames**

Before we begin animating the page elements, we need to do some clean-up work, including converting some graphics to symbols and

reorganizing and creating layers. You can download the current project from the Chapter 2 section of <http://www.phptr.com/essential/flash5> or directly from <http://www.phptr.com/essential/flash5/shelley/shelley1-12.html>.

### ***Creating the Link Text Symbol***

Take a look at the current page, Figure 2–1. The links on the page will all appear to move together in our animation. To allow us to do this easily, we can create a single graphic symbol that contains all of them grouped together.

1. We need to select all the text links. Use the Arrow and hold down the Shift key to select the seven text links: about us, vendors, investors, products, contact us, research, and press releases.
2. Choose **Modify**→**Group**.
3. Choose **Insert**→**Convert to Symbol**.
4. Name the new symbol “Link Text” and set its behavior to Graphic. Click OK.

### ***Creating the Logo Layer***

Flash requires that any symbol to be animated must be in its own layer. The lines connecting the circles need to be moved to their own layer, since we will be animating them. To do this:

**FIGURE 2–1** Current Shelley page.

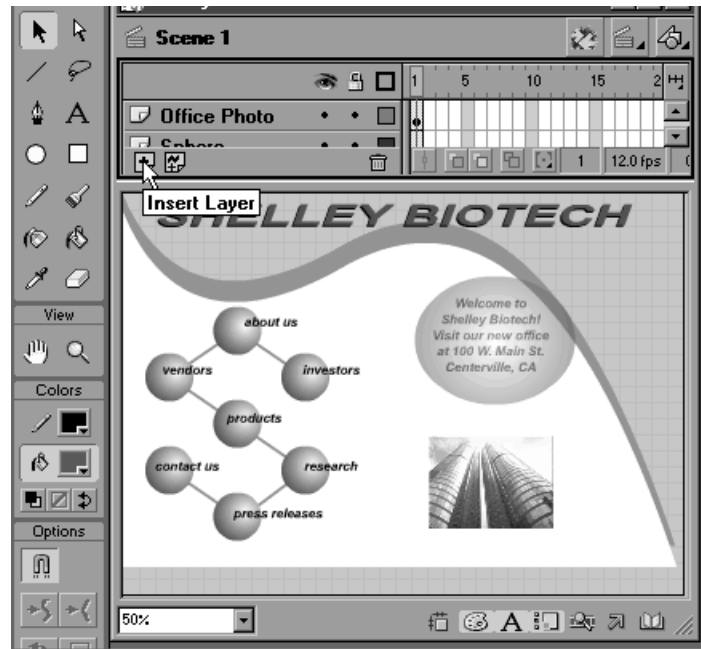

FIGURE 2-2 Flash interface with the Add Layer button.

1. Select the top layer in the layer list and click on the Insert Layer button, shown in Figure 2-2.
2. Name the new layer "Logo."
3. If you haven't already done so, move the Link Text layer over the Circles layer.
4. Click on one of the lines connecting the circles. This will select all the lines and circles, because we grouped them earlier.
5. Choose **Modify** → **Ungroup**.
6. Choose **Edit** → **Deselect All**.
7. Use the Arrow and the Shift key to select all of the lines. If you accidentally select something else, just click on it again with the Shift key held down to deselect it and leave everything else selected.
8. Choose **Edit** → **Cut**.
9. Select the Logo layer.
10. Choose **Edit** → **Paste in Place**. You have now moved the lines to the new layer. They are in front of the circles, but we'll be moving them in a moment.

**FIGURE 2-3** Symbol Properties dialog box.

11. With the lines still selected, choose **Modify**→**Group**.
12. Finally, make the lines into a symbol by selecting **Insert**→**Convert to Symbol**. Name this symbol “Lines” and set its behavior to **Graphic**. See Figure 2-3.

### CHECKPOINT

This would be a good time to save your work. Choose **File**→**Save As**, and save this file in the directory of your choice as *shelley.fla*. Download the project at this point from <http://www.phptr.com/essential/flash5> or view it directly at <http://www.phptr.com/essential/flash5/shelley/shelley2-1.html>.

### *Adding an Additional Background Layer*

Both the white and the brown curves making up the background will be animated. We need a separate layer for each.

1. Click on the Background layer. This layer currently contains both of the background curves.
2. Choose **Insert Layer** from the Layer menu. This will place a new layer immediately above the Background layer.
3. Rename this “Background 1.”
4. Select the white curve. Choose **Edit**→**Cut**.
5. Select the Background 1 layer and choose **Edit**→**Paste in Place**.
6. Rename the original Background layer “Background 2.”

### ***Creating Some Layers for the Circles***

The last organizational change you need to make involves moving each of the seven circles to separate layers so each can be animated separately.

1. Select the Background 1 layer and create seven new layers.
2. Name them as follows: Press Releases, Research, Contact Us, Investors, Vendors, About Us, and Products. Don't worry about the order; we will adjust that in a moment.
3. We need to move each one of our current circles to one of these new layers. For each of our seven circles, select it, choose Edit→Cut, click on the appropriate new layer (according to the text link overlapping it), and choose Edit→Paste in Place.
4. When all the circles have been moved, the Circles layer will have nothing left in it. Get rid of it by selecting it and choosing Delete Layer from the Layer menu.

Select and drag the layers up and down to move them. Put your layers in the following order, from top to bottom:

1. Header Text. This is the Shelley Biotech banner and associated shadow.
2. Link Text.
3. Address Text.
4. Address Sphere. This is the sphere under the Address Text.
5. Office Photo.
6. Link Circle layers. Each of the seven circles should be in a separate layer.
7. Logo. This consists of the seven lines that connect the link circles.
8. Background 1. The white curve.
9. Background 2. The brown curve.

### **CHECKPOINT**

This would be a good time to save your work. Choose File→Save As, and save this file in the directory of your choice as *shelley fla*. Download the project at this point from <http://www.phptr.com/essential/flash5> or view it directly at <http://www.phptr.com/essential/flash5/shelley/shelley2-2.html>.

## Frames and Animation

One of the most important aspects of a Flash movie is the animation, which is nothing more than a series of still images, displayed over time. Each of these still images is called a frame. The speed at which the frames are displayed is controlled by the fps (frames per second) setting in Flash. A setting of 12 fps, which is the default setting, means that 12 frames will be displayed every second.

There are two ways to change the fps value:

1. Double-click the fps box, which is located just below the timeline. See Figure 2-4.
2. Choose the menu option **Modify** → **Movie**.

Both of these open the Movie Properties dialog box, shown in Figure 2-5. The first blank on this dialog box contains the frame rate. A rate between 8 and 15 is recommended. This range allows relatively speedy processing of the animation while retaining smoothness of motion. For our animation, make sure the value is set at 12.

## Tweening and Keyframes

Before the advent of computers, cartoon animators had to draw each frame of an animation. Although you can do that with Flash, you are provided with a time-saving method of animation that requires you to create only the most important frames. Flash creates the intermediate frames for you. This is called *tweening*. In using tweening, you create only special frames, called *keyframes*, to serve as turning points during an animation, and Flash fills in the gaps. For example, if you wanted to animate an object mov-

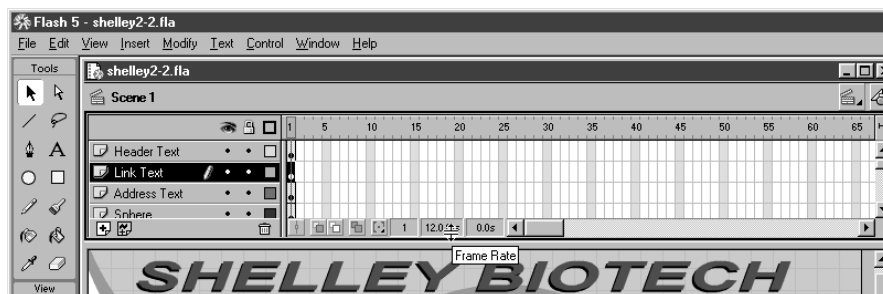

FIGURE 2-4 The frames per second box.

**FIGURE 2-5** The Movie Properties dialog box. The frames per second rate can be changed here.

ing to the right, hitting the edge of the screen, and moving left, you would only have to create three keyframes, and tell Flash to do the rest.

### ***Adding Keyframes to the Shelley Biotech Page***

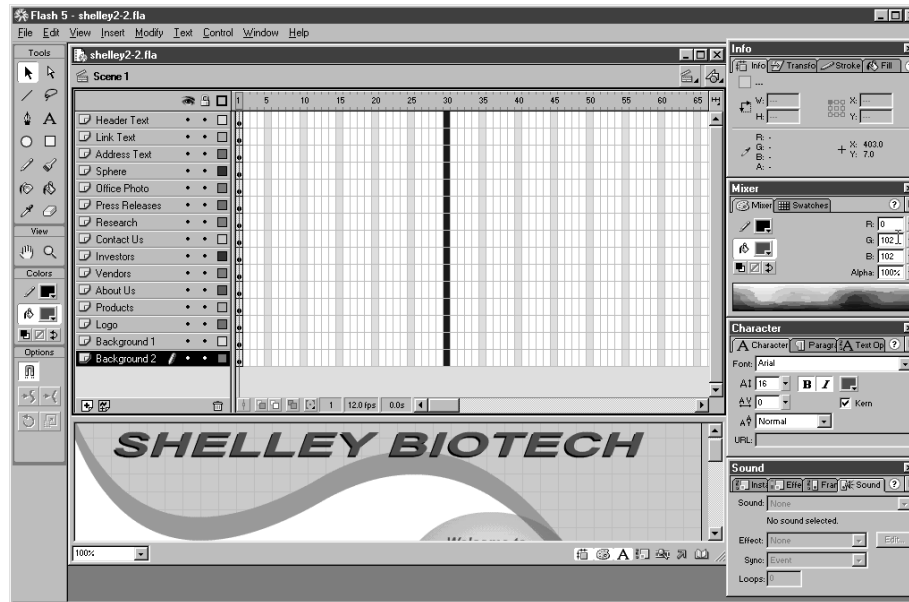

We can now put in place the keyframes we will need for the Shelley page.

1. Open the latest version of the Shelley file. This can be downloaded from <http://www.phptr.com/essential/flash5/shelley/shelley2-2.html>.
2. We now need to select the thirtieth frame of all the layers. To do this, click and hold on the frame area at the 30 frame mark of the top layer and drag downward until all the layers are selected, as shown in Figure 2-6. This is a little tricky.
3. Choose Insert→Keyframe. Your timeline should now look like Figure 2-7.

### **CHECKPOINT**

This would be a good time to save your work. Choose File→Save As, and save this file in the directory of your choice as *shelley fla*. Download the project at this point from <http://www.phptr.com/essential/flash5> or view it directly at <http://www.phptr.com/essential/flash5/shelley/shelley2-3.html>.

**50 Chapter 2 • Animating the Page****FIGURE 2-6** Selecting the thirtieth frame of all the layers.

We still have no animation, even though we have multiple frames. If you click on the first or last keyframe or any frame in between, you will notice that nothing changes. Two things still need to be done: First, you select a keyframe and make some change to the graphic at that point. Then you must tell Flash what kind of tweening to use. Flash can tween the movement of an object as well as its shape and color.

The next section will show you how to animate the graphics on this page. One final note: The graphics we created in Chapter 1, “The Basics,” are the final product of the animation. We will be working backward and modifying the first keyframe, while leaving the last one alone. To get a clearer picture of this, go look at the finished product at <http://www.phptr.com/essential/flash5/shelley/new/> and notice that the page ends up looking like our current file, but looks totally different when you first see it.

## Movement Tweening 51

FIGURE 2-7 Current timeline.

### ◆ Movement Tweening

The animation you will perform more than any other will be movement tweening. This consists of giving an object a starting and an ending location and letting Flash interpolate the frames in between. Movement tweening also interpolates on the basis of object size and rotation.

#### *Animating the Tan Background Curve*

For our first animation trick, we will be making the brown background curve move. Figure 2-8 shows the path of this object. Only the outlines of the object are shown. In Flash, this view is called *onion-skinning*.

**FIGURE 2-8** The animated path of the tan background object. The darker lines indicate the most recent events.

1. Begin by selecting the Background 2 layer and hiding all the others, using the Layer menu.
2. Click on the first keyframe. This is the frame located at 1 on the timeline that has a solid black circle in it.
3. You will be moving the curve partly off the movie stage. To allow you to see it, choose View→Work Area. You may also find it useful to use the Zoom drop-down box (located on the bottom left edge of the current movie) set to 50% or smaller.
4. Change to the Arrow tool. Select the curve and move it to the left and down, as shown in Figure 2-9.
5. Add a keyframe at 14 by clicking at the 14 mark on the Background 2 layer and selecting Insert→Keyframe.
6. Click on this new keyframe.
7. Move the curve up, as shown in Figure 2-10.
8. Click on a frame anywhere between the first and second keyframes. Choose Window→Panels→Frame to open the Frame panel. You can also right-click (PC) or Ctrl-click (Mac) and select Panels→Frame from the pop-up menu.
9. Select Motion from the Tweening drop-down box on this panel. Scale should be checked, and Rotate should be set to Auto. The Easing slider should be set to 0. See Figure 2-11.

**FIGURE 2-9**  
Tan curve location  
at first keyframe.

**FIGURE 2-10**  
Tan curve location at  
second keyframe.

**FIGURE 2-11**  
Frame panel.

10. Click on a frame anywhere between the second and third keyframes, and repeat step 9.
11. To test your animation, press the Enter key, or select Control→Play.

**CHECKPOINT**

This would be a good time to save your work. Choose File→Save As, and save this file in the directory of your choice as *shelley.fla*. Download the project at this point from <http://www.phptr.com/essential/flash5> or view it directly at <http://www.phptr.com/essential/flash5/shelley/shelley2-4.html>

**A Quick Word about Onion-Skinning**

Flash has a very nice feature that allows you to see the stages of an animated object over time. This is known as an *onion-skin view*. It displays the graphic in each frame at the same time, giving you a picture of the path it is taking. The first frames are fainter than the later frames.

To use it, select the Onion Skin button, shown selected at the bottom of Figure 2–12. Notice the handles that appear on the timeline above all the layers. Change the frame interval by dragging the right handle to frame 30. This image also shows the Onion Skin markers on the timeline. The color changes over time, with the faintest images representing the early frames. Turn it off by clicking on the Onion Skin button again. If you only wish to see the outlines, click on the Onion Skin Outlines button.

**FIGURE 2–12** Onion Skin markers on the timeline.

### *Animating the Link Circles*

The link circles will start out fairly large and centered on the Products circle. They will shrink and move outward to their appropriate places. They will also initially be transparent and fade in. Don't worry, this sounds more complex than it actually is!

1. Begin by selecting the Products layer and hiding all the others, using the Layers Menu → Hide Others option.
2. Click on the red X next to the names of the other six link circle layers to make them appear. You should now see seven circles against the tan background, as in Figure 2-13.
3. Hold down the Ctrl key and select the fifteenth frame on each of these layers and choose Insert → Keyframe. See Figure 2-14.
4. Select the center circle with the Arrow. The Products layer should now be selected.
5. Drag the Products layer below the other circle layers.
6. Click on the first keyframe of the Products layer, located at frame 1. The circle in this layer should be selected.
7. Open the Info panel if it is not open, by choosing Window → Panels → Info.

**FIGURE 2-13** Link circles.

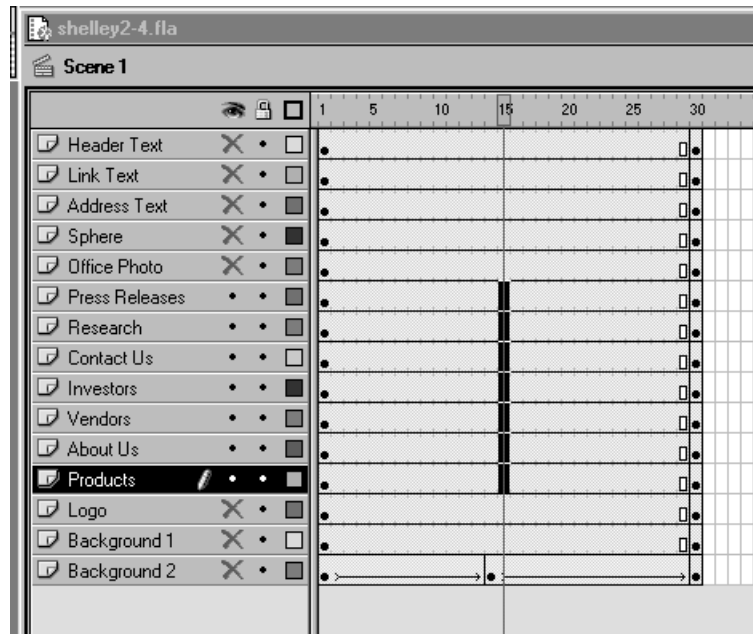

FIGURE 2-14 Inserting a keyframe.

8. On the Info panel, there is a cluster of nine small boxes. Click on the box in the center, as shown in Figure 2-15, and change the Width (w) and Height (h) each to 300. Press Enter.
9. Make sure the first keyframe is still the current one selected. Using the Arrow and Shift keys, select all of the circles.
10. Open the Align panel by choosing Window→Panels→Align.

FIGURE 2-15  
Info panel.

**FIGURE 2-16**  
Align panel.

11. We want all the circles to be 300 pixels by 300 pixels and in the same location. To do this, click on the two middle buttons under the Align label. Look at the buttons shown in Figure 2-16.
12. Now click on the Match Size button on the right. This will make all the circles 300 pixels by 300 pixels and centered, so only one will be visible, with the rest stacked under it.
13. We need to set the tweening for the circle layers. For each of the seven link circle layers, click on a frame anywhere between the first and second keyframes. Open the Frame panel.
14. Select the Tweening tab on the Frame panel. Choose Motion from the drop-down list. Scale should be checked, and Rotate should be Automatic. The Easing slider should be 0.
15. Take a look at the animation you just added by pressing Enter.

We still need to make the circles start transparent and fade in. We will do this by changing the transparency for the circles at the first keyframes of each layer. This should be clearer to you in a moment.

1. Open the Effect panel. You can do this by clicking on the tab labeled “Effect” on the Frame panel dialog, or from Window → Panels → Effect. See Figure 2-17.
2. The Effect for the circles at the first keyframe needs to be changed. Click on the Products layer and hide the others.
3. Click on the first keyframe in this layer. The large circle visible on the stage should be selected.
4. Choose Alpha from the drop down box on this panel. Set the value to 0%.

**FIGURE 2-17**  
Effect panel.

5. Repeat steps 2 through 4 for each of the other six layers. Make sure you are making this change on the large circle located at the first keyframe!
6. Select Show All from the Layer menu.

We are getting closer, but still have a few more animations to add.

### CHECKPOINT

This would be a good time to save your work. Choose File→Save As, and save this file in the directory of your choice as *shelley fla*. Download the project at this point from <http://www.phptr.com/essential/flash5> or view it directly at <http://www.phptr.com/essential/flash5/shelley/shelley2-5.html>.

### Animating the Address Text

Let's make the Address Text really large when the animation begins. It will also change color, but we'll do that a bit later in the section on Fading. To preview what the Address Text will be doing, look at Figure 2-18, which shows the onion-skinned version of the animation.

1. Click on the first keyframe of the Address Text layer.
2. Select View→Work Area. Use the Zoom Control and change the zoom to 50% or less.
3. Use the Layer menu to hide all the layers except for the Address layer. With the Arrow, select the address text.

**FIGURE 2-18**

Onion-skin view of address text animation.

Click on the red X next to the Background 2 layer to make it visible also.

4. We need to turn the address text into a symbol so we can animate it. Make sure you are on the first keyframe and choose **Insert→Convert to Symbol**. Name it “Address Text,” change its behavior to Graphic, and click OK.
5. Now we have a small problem. The address text in the first keyframe is a symbol, but the address text in the last keyframe is not. We need to replace it with the symbol version. It’s easy enough to do. Click on the last keyframe on the Address Text layer and choose **Insert→Clear Keyframe**.
6. Now put a keyframe back at this location by choosing **Insert→Keyframe**. The Address Text symbol we just created will now be present.
7. Select the first keyframe of the Address Text layer and make sure the Address Text symbol is selected.
8. Click on the Scale button on the bottom of the toolbar. Using the handles or Object Inspector, stretch the address text until it is approximately 1000 pixels wide and 1060 pixels high. You may want to do this with the Info panel instead of scaling it.
9. Reposition and resize until the word “Shelley” is located on top of the visible part of the tan curve, as in Figure 2-19. No other words should overlap the visible part of the tan curve.

FIGURE 2-19 Address text stretched and moved.

10. Click on a frame between the two keyframes on the Address Text layer. Open the Frame panel.
11. Select the Tweening tab on this dialog box. Choose Motion from the drop-down list. Scale should be checked, and Rotate should be Automatic. The Easing slider should be set to 0.
12. To see the results, press Enter.

#### CHECKPOINT

This would be a good time to save your work. Choose File → Save As, and save this file in the directory of your choice as *shelley fla*. Download the project at this point from <http://www.phptr.com/essential/flash5> or view it directly at <http://www.phptr.com/essential/flash5/shelley/shelley2-6.html>.

#### Animating the Text Links

The text links will be very small and on the right side of the screen, then grow in size and move left. Figure 2-20 shows the onion-skinned path of these objects.

**FIGURE 2-20**  
Onion-skin view of text links  
with page border shown.

1. Begin by selecting the Link Text layer and hiding all the others, using the Layers menu.
2. Click on the first keyframe.
3. Open the Info panel and resize the group of links to approximately 40 pixels  $\times$  40 pixels and to move it to an (X, Y) location of (500, 250).
4. Click on a frame between the two keyframes on this layer. Open the Frame panel.
5. Select the Tweening tab on this dialog box. Choose Motion from the drop-down list. Scale should be checked, and Rotate should be Automatic. The Easing slider should be set to 0.
6. To see the results, press Enter.

### CHECKPOINT

This would be a good time to save your work. Choose File  $\rightarrow$  Save As, and save this file in the directory of your choice as *shelley.fla*. Download the project at this point from <http://www.phptr.com/essential/flash5> or view it directly at <http://www.phptr.com/essential/flash5/shelley/shelley2-7.html>.

### Animating the Header Text

Figure 2-21 shows the onion-skinned path of this object.

FIGURE 2-21 Onion-skin view of header text with page border shown.

1. Begin by selecting the Header Text layer and hiding all the others, using the Layers menu.
2. Click on the first keyframe.
3. Open the Info panel. Resize the Header Text to approximately 130 pixels by 10 pixels and to move it to an (X, Y) location of (630, 90).
4. Click on a frame between the two keyframes on this layer. Open the Frame panel.
5. Select the Tweening tab on this dialog box. Choose Motion from the drop-down list. Scale should be checked, and Rotate should be Automatic. The Easing slider should be set to 0.
6. To see the results, press Enter.

If you haven't viewed the entire page animation already, select Show All from the Layers menu. Press Enter. You have now added all the motion tweening to the page. Now let's do some Shape tweening.

#### CHECKPOINT

This would be a good time to save your work. Choose File→Save As, and save this file in the directory of your choice as *shelley fla*. Download the project at this point from

<http://www.phptr.com/essential/flash5>

or view it directly at

<http://www.phptr.com/essential/flash5/shelley/shelley2-8.html>.

## ◆ Shape Tweening

Shape tweening animation is used when you need to change or morph one shape into another. The shape and the color shifts

gradually from the beginning graphic to the final one. As in motion tweening, Flash will interpolate the intermediate frames for you. Shape tweening is best used somewhat sparingly, as it increases the final size of the Flash movie much more than Motion tweening does.

In the Shelley Biotech page, only one object undergoes shape tweening. This is the semitransparent egg-shaped sphere underneath the address text. We will make it start out as a large S and morph into the sphere.

### *Creating the Beginning S Shape*

Now, we need to create the starting S shape.

1. Select the Sphere layer and hide the other layers.
2. Click on the first keyframe of the Sphere layer.
3. Change to the Text Tool and open the Character panel. Set the font to Arial, the size to 72, the color black, and click on both the Bold and Italic buttons.
4. Click on the scene and type an uppercase S. Change to the Arrow Tool.
5. Select the oval shape in this keyframe and delete it with the Delete key.
6. Select the S and open the Info panel.
7. Resize the S to approximately 30 width by 155 height in pixels.
8. Choose **Modify** → **Break Apart**. This will allow us to apply a gradient fill to the S.
9. We should make the S have the same colors as the final sphere it will become. Change to the Paint Bucket. Click on the Palette button at the bottom of the Tools menu. Select the gradient fill from the bottom of the color palette that was used to fill the link circles. See Figure 2-22.

**FIGURE 2-22**  
Gradient fill.

**FIGURE 2-23**  
S shape.

10. Click on the S shape with the Paint Bucket somewhere near the center.
11. Click on the Header Text layer to make it visible. Make sure the S is lined up with the first letter of the header, as shown in Figure 2-23, by selecting it, moving it, and using the Scale option with the Arrow.

Now that we have our starting and ending shapes, we can perform shape tweening and let Flash fill in the frames between them.

### *Applying Shape Tweening to the S*

1. Hide the Header Text layer and all other layers except for the Address Sphere layer.
2. Click on any frame between the starting and ending keyframes on the Address Sphere layer.
3. Open the Frame panel.
4. Choose Shape Tweening with the Blend of Distributive, and change the Easing to -100, as in Figure 2-24. Moving the Easing slider left makes the tweening start slowly and then speed up near the end.
5. Press Enter to view the shape tweening.

**FIGURE 2-24**  
Tweening tab of Frame Properties dialog box.

### CHECKPOINT

This would be a good time to save your work. Choose File→Save As, and save this file in the directory of your choice as *shelley.fla*. Download the project at this point from

<http://www.phptr.com/essential/flash5>

or view it directly at

<http://www.phptr.com/essential/flash5/shelley/shelley2-9.html>.

### Adding Shape Hints

Shape hints are markers you place on the beginning and ending shapes in a shape tweening to tell Flash how to proceed in the frames between the two keyframes. When you create a shape hint, Flash puts a small, labeled circle on the image at both the first and second keyframes. You can use the Arrow to move these markers. If you place the marker at the top of the image in the first keyframe, and at the bottom of the image in the second, the image will appear to turn itself inside out, with the top migrating toward the bottom during the animation.

1. Select the first keyframe in the Address Sphere layer.
2. Choose Modify→Transform→Add Shape Hint. A small red circle with a letter *a* in it appears. Use the Arrow to move it away from the S.
3. Add two more shape hints, *b* and *c*, and move them so all three are visible.
4. Move the letters to the locations shown in Figure 2–25.
5. Click on the last keyframe. Matching letters are stacked in the center of the oval. Move them to the locations shown

**FIGURE 2–25**

Shape hints correctly placed on the S graphic.

**FIGURE 2-26** Shape hints correctly placed on the transparent oval.

in Figure 2-26. These will turn green when they are in valid locations.

6. Press Enter to see the result of the shape hint influence on the shape tweening.
7. To hide the shape hints from the view, uncheck View→Show Shape Hints.

### CHECKPOINT

This would be a good time to save your work. Choose File→Save As, and save this file in the directory of your choice as *shelley.fla*. Download the project at this point from <http://www.phptr.com/essential/flash5> or view it directly at <http://www.phptr.com/essential/flash5/shelley/shelley2-10.html>.

If you make all the layers visible at this point and animate them, you'll notice that the page is rather cluttered. We will fix that in the next section.

## ◆ Fading

Now all that remains to be done is to apply some fading to the beginning keyframes of some of the images. This will help to

clean up much of the clutter you see when you view the entire animation.

### ***Fading in the White Background***

The white background layer is nice for the final frame of the animation, but is a bit distracting while the animation is taking place. Let's make it fade in.

1. We made the white background a symbol in Chapter 1. This allows us to modify its Instance Properties. Select the Background 1 layer and hide all the rest.
2. Click on the first keyframe.
3. With the Arrow, select the white curve. Open the Effect panel.
4. Choose Alpha from the drop-down list and set the value to 0% by moving the slider down or typing in the text box. See Figure 2-27. Press Enter.
5. Click on a frame between the two keyframes on the White Background layer. Open the Frame panel.
6. Choose Motion from the drop-down list. Scale should be checked, and Rotate should be Automatic. Easing should be set to 0. Press Enter.
7. To see the results, press Enter.

### **CHECKPOINT**

This would be a good time to save your work. Choose File → Save As, and save this file in the directory of your choice as *shelley.fla*. Download the project at this point from <http://www.phptr.com/essential/flash5> or view it directly at <http://www.phptr.com/essential/flash5/shelley/shelley2-11.html>.

**FIGURE 2-27**  
Effect panel.

### *Fading in the Office Photo*

The office photo will also fade in. The procedure is basically the same as before, except that the fade-in will begin at the fifteenth frame.

1. Select the Office Photo layer and hide all the rest.
2. Click on the first keyframe.
3. With the Arrow, select the photo.
4. We need to make the photo a symbol so we can modify its transparency. Choose Insert→Convert to Symbol. Name it “Photo,” set its behavior to Graphic, and click OK.
5. Click on the keyframe at 30 and choose Insert→Clear Keyframe. This will remove the keyframe at 30 that does not have the Photo symbol in it. The photo in this frame was not the photo symbol you created in step 4. To create the fade effect, it must be the same symbol.
6. Now add a keyframe to 30 again by choosing Insert→Keyframe. This time the photo image will be the Photo symbol you created.
7. Click on the first keyframe again. Select the photo.
8. Open the Effect panel.
9. Choose Alpha from the drop-down list and set the value to 0% by moving the slider down or typing in the text box. See Figure 2–27. Press Enter.
10. Click on the fifteenth frame and choose Insert→Keyframe.
11. Click on a frame between the second and third keyframes on the Office Photo layer. Open the Frame panel.
12. Choose Motion from the drop-down list. Scale should be checked, and Rotate should be Automatic. Easing should be set to 0. Press Enter.
13. Press Enter to see the result. The fade-in begins at the fifteenth frame and finishes at the thirtieth.

### **CHECKPOINT**

This would be a good time to save your work. Choose File→Save As, and save this file in the directory of your choice as *shelley.flm*. Download the project at this point from  
<http://www.phptr.com/essential/flash5>  
or view it directly at  
<http://www.phptr.com/essential/flash5/shelley/shelley2-12.html>.

### *Fading in the Logo Lines*

The lines connecting the link circles should also be faded in.

1. Select the Logo layer and hide all the rest.
2. Click on the first keyframe.
3. With the Arrow, select the lines. Open the Effect panel.
4. Choose Alpha from the drop-down list and set the value to 0% by moving the slider down or typing in the text box. See Figure 2-27. Press Enter.
5. Click on a frame between the two keyframes. Open the Frame panel.
6. Choose Motion from the drop-down list. Scale should be checked, and Rotate should be Automatic. Easing should be set to 0. Press Enter.
7. Press Enter to see the result.

#### **CHECKPOINT**

This would be a good time to save your work. Choose File→Save As, and save this file in the directory of your choice as *shelley.fla*. Download the project at this point from  
<http://www.phptr.com/essential/flash5>  
or view it directly at  
<http://www.phptr.com/essential/flash5/shelley/shelley2-13.html>.

### *Changing the Color of the Text Links*

Instead of fading in the text links, we will make the color change. The color will start out the same as the background and then will change to black. This will make the links stand out a bit more than if they were faded in.

1. Select the Link Text layer and hide all the rest.
2. Click on the first keyframe.
3. With the Arrow, select the links. Open the Effect panel.
4. Choose Tint from the drop-down list.
5. Set the Tint Amount percentage to 100.
6. Change the color values on this panel to a red of 204, green of 204, and blue of 153, as shown in Figure 2-28. Press Enter.

**FIGURE 2-28**  
The Effect panel with the  
RGB set appropriately.

7. We don't need to add motion tweening for this layer since we did that earlier when we made the Link Text start small and get larger. To see the results, press Enter.

### CHECKPOINT

This would be a good time to save your work. Choose File→Save As, and save this file in the directory of your choice as *shelley fla*. Download the project at this point from <http://www.phptr.com/essential/flash5> or view it directly at <http://www.phptr.com/essential/flash5/shelley/shelley2-14.html>.

### Changing the Color of the Address Text

Right now, the Address Text symbol starts out very large and dominates the screen. If we change the color of it to the background of our movie, only the word “Shelley” that is over the brown background curve will be visible. We can then make its color change to black as it gets smaller.

1. Select the Address Text layer and hide the others.
2. Click on the first keyframe.
3. The Address Text symbol should now be selected. Open the Effect panel.
4. Choose Tint from the drop-down list and set the Tint Amount percentage to 100.
5. Change the color values to a red of 204, green of 204, and blue of 153, as shown in Figure 2-28. Click OK.
6. Again, we added the Motion tweening earlier, so we do not need to do that now. To see the results, press Enter.

### CHECKPOINT

This would be a good time to save your work. Choose File→Save As, and save this file in the directory of your choice as *shelley.fla*. Download the project at this point from <http://www.phptr.com/essential/flash5> or view it directly at <http://www.phptr.com/essential/flash5/shelley/shelley2-15.html>.

You have created the graphics for the homepage and animated them. In the next chapter, “Making the Page Interactive,” you will add buttons and links to make the page interactive, and we will examine symbols and buttons in depth.

### RECAP

In this chapter you’ve learned how to

- Create symbols and animate them
- Animate the color of symbols
- Animate symbols fading
- Morph shapes

### ADVANCED PROJECTS

1. In a new movie, create several layers with a graphic in each and turn these into symbols.
2. Create a layer with a different graphic at different keyframes.
3. Use shape tweening to morph one shape into another.
4. Try adding shape hints to control the morphing.
5. Animate them so they appear to collide.
6. Use fading and color effects on them before and after the collision.
