Index

Symbols

= (equal) operator, 87

A

abstract entities, 14
abstract relations, 51
accelerator keys, 321–322
Access (application), 7
access keys, 321–322
Access Report Wizard, 312
accidental entries, correcting, 297
ActiveX Data Objects (ADO), 8
ad hoc reports, 301–302, 311–317
additions, tracking, 218
ADO (ActiveX Data Objects), 8
ADO.NET, 8
Advanced Filter/Sort window, 304–305
advanced users, designing for, 239, 319
aggregate functions, SQL, 99–100
AllowZeroLength flag, 78
alternate keys, 33
AND operator, 87
ANSI_NULLS option, 88
applications, 5
architectures for user interfaces, 247–259
AS keyword (SQL), 101
assistance. *See* user assistance
attributes, 11, 14–18
  candidate and primary keys, 32–34
  constraints on, 213, 291–292
  defining data objects, 179–184
  of dimensional tables, 131–132
    changing, 136–138
  for entities, determining, 190–191
  in fact tables, 117
    dimension keys, 117–118
    fact attribute characteristics, 118–126
  functional dependency, 34–35
  of relationships, determining, 187
  restrictions on value ranges, 193–194
audible feedback, 329
audience, for system design, 221–222
auditing, 218–219
AutoLookup operation (Jet database engine), 91
automatic report printing, 310–311
AutoNumber fields, 34

B

base relations, 85
beeping, as user feedback, 329
beginner users, designing for, 238, 319–320, 332
benefit analyses, 162–164
binary relationships. *See* one-to-one relationships
bit flags, 37
body, relation, 12
Boolean logic, 86–88
Boyce/Codd normal form, 41–42
building data models, 148, 179–195
  data object identification, 179–184
  domain analysis, 191–193
  entity review, 188–191
  normalization, 195
  relationship definition, 184–187
  value range restrictions, 193–194
business intelligence, 112–114

riordan.book Page 344 Thursday, December 16, 2004 2:23 PM

business rules, 72, 169–173, 296–299. *See also* integrity constraints; work processes
  entities and, 190
Business Services layer, 198

C

candidate keys, 32–34, 50–51, 190
cardinality of relationships, 11, 48–49
  determining, 186
  known, 62
Cartesian products, 98–99
cascading deletes, 71, 295
cascading updates, 71, 295
change management, 231
character length constraints, 290
CHECK constraints, 77–78, 81, 213
checkbox controls, 277
classic MDI interfaces, 253–255
client/server systems, 208–210
closure, defined, 10–11
code architectures, 197–204
codes, non-scalar values for, 36–37
combo box controls, 278–280
command vectors, 320
communicating about design process, 221–231
communicating with users, 168–169
competence, communicating, 224
component integration, 146–147
components, code, 198–202
composite entries, 188
composite keys, 33
concatenation of recordsets, 95–96
conceptual data model. *See* data model
concrete entities, 14
confirmation messages, 240–241
consistency in user interface design, 243–245
constraints
  for relationships, 188, 190, 214
  specifying in database schema, 213
  on value ranges, 193–194, 276, 292
    Input Mask property, 282, 284–285
controls, 275–286
  for logical values, 276–277
  for numbers and dates, 282–284
  for sets of values, 278–282
  status bar information, 324–325
  for text values, 284–285
conventional value approach, 74
cost-benefit analyses, 162–164, 225
costs, answering questions about, 223
coverage tables, 123
criteria for project success, design, 156–160
crosstab queries, 101
cube operator, 103
CUBE operator (SQL), 103
cubes (dimensional databases), 112. *See also* dimensional databases
custom (ad hoc) reports, 301–302, 311–317
cyclical join dependencies, 44–45

D

DAO (Data Access Objects), 8
data access object models, 8
data architectures, 204–212
data constraints. *See* integrity constraints
data definition environments, 8–9
data dependencies, 173–174
data entry mistakes, handling, 297
data integrity, 65–84
  implementation of, 73–84
  integrity constraints, 65–73
Data Interface layer, 199–200
data marts, 113, 122
data mining, 113–114
data models, 5, 13–22
  building, 148, 179–195
    data object identification, 179–184
    domain analysis, 191–193
    entity review, 188–191
    normalization, 195
    relationship definition, 184–187
    value range restrictions, 193–194
  communicating about, 226–227

riordan.book Page 345 Thursday, December 16, 2004 2:23 PM

differences from reality, handling, 297–299
flexibility, 27–30
integrity maintenance. *See* integrity constraints
data objects, defining, 179–184
Data Services layer, 198
data types, 79–80
choosing, 192–193
constraints on, 193–194, 290
user-defined (UDDTs), 77–78
data validation, 200, 276. *See also* integrity constraints
data warehouse, 113
database design process, 143
building data models, 148, 179–195
data object identification, 179–184
domain analysis, 191–193
entity review, 188–191
normalization, 195
relationship definition, 184–187
value range restrictions, 193–194
communicating to others, 221–231
defining system parameters, 148, 151–165
design criteria, 160–164
system goals, 151–156
system scope, 160–164
defining work processes, 148, 167–173
life cycle models, 143–148
steps of, 148–149
Windows controls, choosing, 275–286
for logical values, 276–277
for numbers and dates, 282–284
for sets of values, 278–282
for text values, 284–285
database engines, 7
database integrity constraints, 72
database reporting. *See* reporting
database schemas, 5, 197–219
code architecture and, 202–204
communicating about, 228
components of, 212–216
data architectures, 204–212
preparing, 148
security, 216–219
database structure, 25–45
basic principles, 31–35
dimensional databases, 107–115, 228. *See also* dimension tables; fact tables
form design and, 272
flexibility, 27–30
normalization, 31, 35–45, 195
Boyce/Codd normal form, 41
first normal form, 35–37
fourth and fifth normal forms, 42–45
second normal form, 38
third normal form, 39–41
redundancy, eliminating, 25–27
database system parameters, defining, 148, 151–165
design criteria, 160–164
system goals, 151–156
system scope, 160–164
database tools, 6–9
databases, defined, 3–6
DataField property, 279
DataGrid controls, 270, 281
datasheets, 281
date values, controls for representing, 282–284
dates, 36
DateTime data type, 36
DateTimePicker controls, 282
deadlines, answering questions about, 223
declarative integrity, 76–77
degree, relation, 11
deletions, tracking, 218
dependencies, determining, 173–174
derived relations, 85
design criteria, developing, 156–160
cost-benefit analyses, 162–164, 225
design process, 143
building data models, 148, 179–195
data object identification, 179–184
domain analysis, 191–193
entity review, 188–191
normalization, 195
relationship definition, 184–187
value range restrictions, 193–194
communicating to others, 221–231

design process *(Continued)*
defining system parameters, 148, 151–165
design criteria, 160–164
system goals, 151–156
system scope, 160–164
defining work processes, 148, 167–173
life cycle models, 143–148
steps of, 148–149
Windows controls, choosing, 275–286
for logical values, 276–277
for numbers and dates, 282–284
for sets of values, 278–282
for text values, 284–285
designing reports, 312–316
detached data architectures, 210–212
detail reports, 307
diagramming relationships, 50
diagramming work processes, 175–177
differences, relational, 97–98
dimension keys, 117–118
dimension tables, 129–139
changing dimensions, 136–139
snowflaking, 134–136
structure of, 129–133
dimensional databases, 107–115, 228
dimension tables, 129–139
changing dimensions, 136–139
snowflaking, 134–136
structure of, 129–133
fact tables, 110, 117–127
grain of, 120–122, 135
structure of, 117–118
types of, 122–124
form design and, 272
directly measurable criteria for success, 158
divide operations, 94–95
document architectures, 249–258
document structure, 222
documentation of work processes, 225–226
documenting work processes, 175–176
domain integrity constraints, 66–68, 77–78
domains, 12, 18–20, 191–193
constraints on, 213
for entities, determining, 190–191
restrictions on value ranges, 193–194
drop-down combo boxes, 279

E

E/R (entity relationship) diagrams, 21–22, 110, 226–227
defining relationships, 184–187
interface architecture and, 247
end users, communicating with, 168–169
engines, 7
English Query tool, 306
entities, 13–14
constraints on, 213, 292–295
reporting. *See* reporting
representing in form design, 261–273
reviewing, 188–191
subclassing, 54–56, 124
weak vs. strong, 48
entity integrity constraints, 69–70, 78–82
entity relationship (E/R) diagrams, 21–22, 110, 226–227
defining relationships, 184–187
interface architecture and, 247
environment criteria for success, 158–159
Equal truth table, 87
equi-join operations, 90
ERDs. *See* E/R diagrams
error messages, 330
errors, printing, 309–310
evolutionary development model, 146–147
Excel, 113
executive summaries, 222–224
expert users, designing for, 239, 319
extend operator, 100
External Access Interface layer, 199, 201

riordan.book Page 347 Thursday, December 16, 2004 2:23 PM

F

fact tables, 110, 117–127
  grain of, 120–122, 135
  structure of, 117–118
  types of, 122–124
facts, 110
  attribute characteristics, 118–126
  heterogeneous, 124–126
fifth normal form, 44–45
filtering data, 302–306
first normal form, 35–37
flags, non-scalar values for, 37
flexibility, 27–30
flowcharts for work processes, 175–177
foreign keys, 50–51
  constraints for, 82–83
  orphaning, 71
foreign relations, 49–50
form-based reports, 308
format, domain, 194
format constraints, 290
formatting reports, 316–317
forms, designing to represent entities, 261–273
forms, filtering by, 304–305
four-layered code architecture, 199–202
fourth normal form, 42–44
FROM clause, SELECT statement (SQL), 86
front-end development, 9
full outer joins, 94
functional dependency, 34–35

G

goals of system, developing, 151–156, 221–222
  design criteria, developing, 156–160
grain, fact tables, 120–122, 135
graphic reporting, 307
graphic user interface. *See* user interface design
GROUP BY clause, SELECT statement (SQL), 86, 99
  CUBE operator, 103
  ROLLUP clause, 102–103
GUI. *See* user interface design

H

HasA relationship type, 48
heading, relation, 12
help systems, 326–328. *See also* user assistance
heterogeneous facts, 124–126
hierarchies in form design, 269–271
HOLAP (hybrid OLAP) systems, 110
hybrid OLAP systems, 110

I

Identity fields, 34
implementation models (user interface), 237
incremental development model, 146–147
index file, performance and, 207–208
indirect interactions with entities, 189
inner joins, 93
input masks, 282
input masks (Input Mask property), 284–285
integration of database components, 146–147
integrity, data, 65–84
  implementation of, 73–84
  integrity constraints, 65–73
integrity constraints, 65–73, 287–300. *See also* data integrity
  business rules, 72, 169–173, 296–299
    entities and, 190
  intrinsic constraints, 288–295
interactions between entities, 189
interface architectures, 247–259
  MDIs (multiple document interfaces), 252–258
  SDIs (single document interfaces), 249–252
  work process support, 247–249

riordan.book Page 348 Thursday, December 16, 2004 2:23 PM

interface design, 149, 228–230
  consistency, 243–245
  effectiveness of, understanding, 235
  empowering users, 239–241
  integrity maintenance. *See* integrity constraints
  interface architectures, 247–259
    MDIs (multiple document interfaces), 252–258
    SDIs (single document interfaces), 249–252
    work process support, 247–249
  minimizing user workload, 242
  models for, 236
  prototypes and specifications, 229–230
  for reporting, 308–309
  representing entities in form design, 261–273
    hierarchies, 269–271
    many-to-many relationships, 271–273
    one-to-many relationships, 265–268
    one-to-one relationships, 264
  user levels, 238
  Windows controls, choosing
    for logical values, 276–277
    for numbers and dates, 282–284
    for sets of values, 278–282
    for text values, 284–285
intermediate users, designing for, 238, 319–320, 332
intersections, relational, 96–97
interviewing users, 168–169
intrinsic constraints, 288–295
IS NULL and IS NOT NULL operators, 88
IsA relationship type, 48

J

Jet database engine, 7
  cascading deletes/updates, 71, 295
  domain support, 19–20
  natural join operations, 91
  physical data types, 79–80
  Relation objects, 83
JOIN clause, SELECT statement (SQL), 86, 90–94
join dependencies, 44–45
join operations, 89–94
junction tables, 58

K

key attributes (fact tables), 110
keyboard shortcuts, 321–322

L

layered paradigm, 199–202
left outer joins, 94
length constraints, 290
levels of security, 217–219
life cycle models, 143–148
limitations. *See* constraints
LinkChildFields property, 280
LinkMasterFields property, 280
list box controls, 278–280, 307
  linked pair of, 281
ListField property, 279
listing reports, 307
logical data types, 66
logical operators, 86–88
logical values, controls for representing, 276–277
lossless decomposition, 31

M

managing change, 231
manifest models (user interface), 237
many-to-many relationships, 20–21, 57–58
  form design and, 271–273
  snowflaking, 134
MDIs (multiple document interfaces), 252–258
measuring project success, 156–160
memory load, minimizing, 242–243
mental models (user interface), 236
menu-based reporting interfaces, 308

riordan.book Page 349 Thursday, December 16, 2004 2:23 PM

menu shortcut keys, 321–322
messages
  error messages, 330–331
  status bar information, 324–325
methodologies, notes on, 149
Microsoft Access, 7
  Access Report Wizard, 312
Microsoft ADO, 8
Microsoft Agent, 332
Microsoft English Query tool, 306
Microsoft Excel, 113
Microsoft Office Assistant, 331–332
minimizing user workload, 242–243
missing information problem, 67, 73–76. *See also* null values
mistakes in data entry, 297
mnemonic access keys, 321–322
modal design, 240
modularity of code, 198–202
MOLAP (multidimensional OLAP) systems, 110
MonthView controls, 282
MSDE (Microsoft Desktop Engine), 7
multi-select list box controls, 281
multidimensional OLAP systems, 110
multiple document interfaces (MDIs), 252–258
multivalued dependency pairs, 43–44

N

N-cubes, 112. *See also* dimensional databases
N-tiered data architectures, 210
natural join operations, 91
natural language interface, 306
networked databases, 206, 209
noise feedback, 329
nonexistent values, 67, 73–76
normal forms, 31
normalization of databases,31, 35–45, 195
normalized databases, defined, 108
normalizing dimensions, 134–136
Not Equal truth table, 87
novice users, designing for, 238, 319–320, 332
Null values, 74–76, 86–88
  aggregate functions, 100
  constraints on, 291
numeric values, controls for representing, 282–284

O

objects, defining, 179–184
Office Assistant, 331–332
OLAP (on-line analytical processing) systems, 108
OLTP (on-line transactional processing) systems, 108, 113
on-demand report printing, 310–311
one-to-many relationships, 20–21, 57
  form design and, 265–268
one-to-one relationships, 20, 20–21, 47, 52–66
  form design and, 264
online help, 326–328
operations on relations, 85–104
  extensions to, 99–103
  relational operations, 88–95
  Set operations, 95–99
option button controls, 277, 280
optionality of relationships, 48–49, 56
  determining, 186–187
OR operator, 87
ORDER BY clause, SELECT statement (SQL), 89, 302
orphan entities, 70–71, 288
outer join operations, 93–94
Outlook-style interfaces, 251
overriding business rules, 297–299

P

paging mechanism, 211–212
parameter definition process, 148, 151–165
  design criteria, 160–164
  system goals, 151–156
  system scope, 160–164

riordan.book Page 350 Thursday, December 16, 2004 2:23 PM

partial relationship participation, 20–21, 47
participants of relationships, defined, 20–21, 47
passive mechanisms, user assistance, 320–325
passwords, 217–219
performance, data architectures and, 208–212
physical data types, 79–80
physical tables, defining in schemas, 213–215
PIVOT clause, 102
primary keys, 32–34, 288
  blank fields for, 293
  unique indices vs., 82
primary relations, 49–50
printer errors, 309–310
privileges, assigning, 217
proactive mechanisms, user assistance, 320, 331–332
problem space, 4–5, 188
procedural integrity, 76–77
process analyses, 168–169
profiles, user, 177
project interfaces, 256
projection operator, 89
prototyping user interface, 229–230, 237
purpose of system design, 221–222

Q

queries (Jet database engine), 85
  stored queries, 215–216

R

radio button controls, 277, 280
ranges of values, restricting, 193–194, 292
reactive mechanisms, user assistance, 320, 325–331
reality, differences from system model, 297–299
recordsets. *See* relations
redimensioning tables, 136–139
redundancy
  eliminating, 25–27
  fact tables, 118
referential integrity constraints, 70–72, 82–83, 292–295
regular entities, 48
Relation objects (Jet database), 83
relational algebra, 85–104
  extensions to, 99–103
  relational operations, 88–95
  Set operations, 95–99
relational model, 9–13
relational OLAP systems, 110
relations (recordsets), 10
  candidate and primary keys, 32–34
  defined, 11
  tracking user activity, 218–219
  virtual, 200
relationships, 20–22, 47–64
  binary, 20, 47
  cardinality. *See* cardinality of relationships
  constraints on, 188, 190, 214
  defining, 184–187, 213–215
  diagramming, 50
  hierarchies in form design, 269–271
  many-to-many, 20–21, 57–58
    form design and, 271–273
    snowflaking, 134
  modeling, 49–52
  one-to-many, 20–21, 57
    form design and, 265–268
  one-to-one, 20–21, 52–56
    form design and, 264–265
  optionality of, 48–49, 56
    determining, 186–187
  participants of, defined, 20–21, 47
  ternary, 20, 47, 60–62
  unary, 47, 58
rename operator, 100–101
repeating groups, 37
Report Wizard, 312

riordan.book Page 351 Thursday, December 16, 2004 2:23 PM

reporting, 301–318
  ad hoc (custom) reports, 301–302, 311–317
  printing reports, 309–311

Rich Textbox controls, 285
right outer joins, 94
risks, communicating about, 223–224
ROLAP (relational OLAP) systems, 110
ROLLUP clause (SQL), 102–103
rollup operator, 102–103
Row Fix-Up operation (Jet database engine), 91

S

scenarios, 177
schemas, 5, 197–219
  code architecture and, 202–204
  communicating about, 228
  components of, 212–216
  data architectures, 204–212
  preparing, 148
  security, 216–219
scope of system, 160–164
scroll bar controls, 283–284
scrubbing, 133
SDIs (single document interfaces), 249–252
searching data, 302–306
second normal form, 38–39
security issues, 216–219
SELECT statements (SQL), 85–86
  extensions to, 99–103
  relational operations, 88–95
  searching, sorting, and filtering, 302–306
  set operations, 95–99
  storing, 215–216
semi-additive facts, 119
service components, 198
sets of values, controls for representing, 278–282
share-level security, 217
shortcut keys, 321–322
simple keys, 33
single document interfaces (SDIs), 249–252
single-tier data architectures, 204–208
slider controls, 283–284
snapshot tables, 122
snowflake schemas, 111
snowflaking, 134–136
soft changes, tracking, 137–138
sorting data, 302, 305
sound feedback, 329
speaking with end users, 168–169
specifications for user interface, 230
spinner controls, 283
spiral model, 145
SQL Server, 7
  aggregate functions, 99–100
  domain support, 19–20
  physical data types, 79–80
  UDDTs (user-defined data types), 77–78
standalone systems, 204–206
standard letters, 316–317
standard reports, 301, 306–311
standards, notes on, 149
star schemas, 110
state, defined, 211
state-transition diagram, 68
status bars, 324–325
stored queries, 215–216
strategies for design, 160
sub-datasheets, 270
sub-form controls, 281
subclassing, 54–56, 124

riordan.book Page 352 Thursday, December 16, 2004 2:23 PM

success, developing criteria for, 156–160
  cost-benefit analyses, 162–164, 225
summarize operator, 99–100
summary reports, 307
support mechanisms (user assistance), 319–333
  passive mechanisms, 320–325
  proactive mechanisms, 320, 331–332
  reactive mechanisms, 320, 325–331
  training, 332
surrogate keys, 130–131
switchboard applications, 255
system architectures, 197–212
system model vs. reality, 297–299
system overview, documenting, 224–225
system parameters, defining, 148, 151–165
  design criteria, 160–164
  system goals, 151–156
  system scope, 160–164
system reports. *See* reporting
system scope, determining, 160–164

T

tables, defining in schemas, 213–215
task-based architectures, 247–249
tasks. *See also* work processes
  defined, 167
  dependencies, determining, 173–174
  identifying, 169–173
  user scenarios, 177
ternary relationships, 20, 47, 60–62
text length constraints, 290
text values, controls for representing, 278–282
textbox controls, 284–285
theta-join operations, 92–93
thin clients, 211
third normal form, 39–41
three-tiered code architecture, 198
three-valued logic, 86–88
timeline, answering questions about, 223
toolbar-based reporting interfaces, 308
tools for databases, 6–9
ToolTips, 322–323
total relationship participation, 20–21, 47
tracking changes to dimensional databases, 137–138
tracking user activity, 218–219
transaction integrity, 72–73
Transaction Interface layer, 199–201
transaction tables, 122
transform operator, 101–102
TRANSFORM statement (SQL), 101–102
transition integrity constraints, 68–69
TreeView controls, 270, 281
trigger procedures, 77
tuples, 11. *See also* cardinality of relationships
  transition integrity constraints, 68–69
two-tiered data architectures, 208–210
type-compatible domains, 19

U

UDDTs (user-defined data types), 77–78
unary relationships, 47, 58
unions, relational, 95–96
unknown values, 67, 73–76
update anomalies, 26
Update method, 200–201
UpDown controls, 283
usability testing, 237
usage scenarios, 177
user assistance, 319–333
  passive mechanisms, 320–325
  proactive mechanisms, 320, 331–332
  reactive mechanisms, 320, 325–331
  training, 332
user-centered design, 239–240
user-defined data types (UDDTs), 77–78
user expertise, designing for, 238–239, 319
user interface design, 149, 228–230
  consistency, 243–245
  effectiveness of, understanding, 235
  empowering users, 239–241

riordan.book Page 353 Thursday, December 16, 2004 2:23 PM

integrity maintenance. *See* integrity constraints
interface architectures, 247–259
MDIs (multiple document interfaces), 252–258
SDIs (single document interfaces), 249–252
work process support, 247–249
minimizing user workload, 242
models for, 236
prototypes and specifications, 229–230
for reporting, 308–309
representing entities in form design, 261–273
hierarchies, 269–271
many-to-many relationships, 271–273
one-to-many relationships, 265–268
one-to-one relationships, 264
user levels, 238
Windows controls, choosing
for logical values, 276–277
for numbers and dates, 282–284
for sets of values, 278–282
for text values, 284–285
User Interface layer, 199
user-level security, 217
user scenarios, 177
User Services layer, 198
users, communicating with, 168–169

V

validating data, 200, 276. *See also* integrity constraints
ValidationRule property, 81
value ranges, restricting, 193–194, 292
value sets, controls for representing, 278–282
variable-length character fields, 290
views (SQL Server), 85, 215–216
violation responses, 76
virtual recordsets, 200

W

waterfall model, 143–144
weak entities, 48
weighted benefit analyses, 162–164
What's This? tips, 328–329
WHERE clause, SELECT statement (SQL), 89, 302
Windows controls, 275–286
for logical values, 276–277
for numbers and dates, 282–284
for sets of values, 278–282
for text values, 284–285
wizards, 257–258
work processes, 72
analyzing, 173–174
communicating about, 225–226
defining, 148, 167–173
defining data objects, 179–184
documenting, 175–176
entity effects, determining, 188–189
supporting with interface architectures, 247–249
workbook applications, 250

X

XOR operator, 87
