Perspective Pasting with Vanishing Point

The revolutionary Vanishing Point filter lets you auto paste, clone, and brush objects and image elements in perfect perspective.

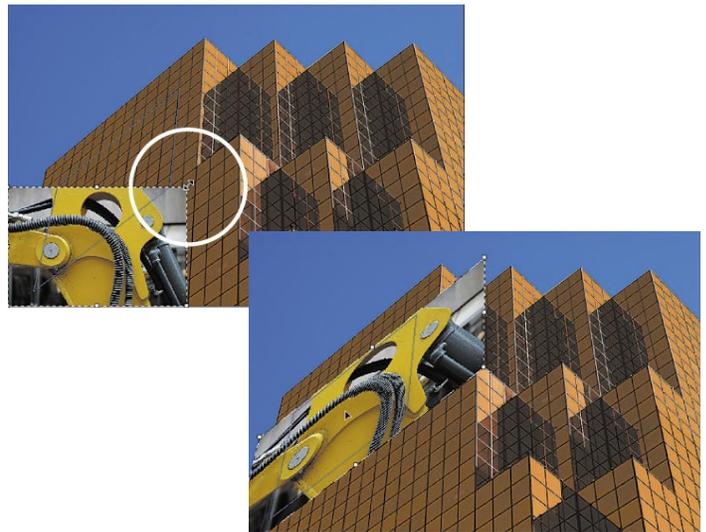

Step One: Open the source photo that you want to paste an object into. Then add a new blank layer by clicking on the Create a New Layer icon at the bottom of the layers palette.

Step Two: Next, open the photo for pasting. Select the entire photo with Command-A, (PC: Control-A) and copy into memory. Close photo file.

Step Three: Go to the Filter menu and choose Vanishing Point. Next, get the Create Plane tool. Use it to map the perspective by drawing a rectangle in the source photo where you want to add the object. Once your points are in place, a blue grid should appear (it's blue if you drew the perspective right). If it's yellow, get the Edit Plane tool (it looks like an arrow in the Toolbox) and adjust your points until it turns blue. Note: If your grid turns red, it's a bad grid (your perspective is off), and you'll need to tweak the points before proceeding.

Step Four: Press Command-V (PC: Control-V) to paste the photo into Vanishing Point. Luckily, Vanishing Point lets you resize using Free Transform, Command-T (PC: Control-T). Bring up the Free Transform bounding box, press-and-hold the Shift key, grab a center point, and drag inward to adjust your photo to the approximate size you want.

Step Five: Click the center of the photo and drag it up to the faint outline of the grid. The photo should pop onto the grid in perfect perspective when the cursor enters the grid area. Use the Free Transform tool to size the photo as needed and click OK.

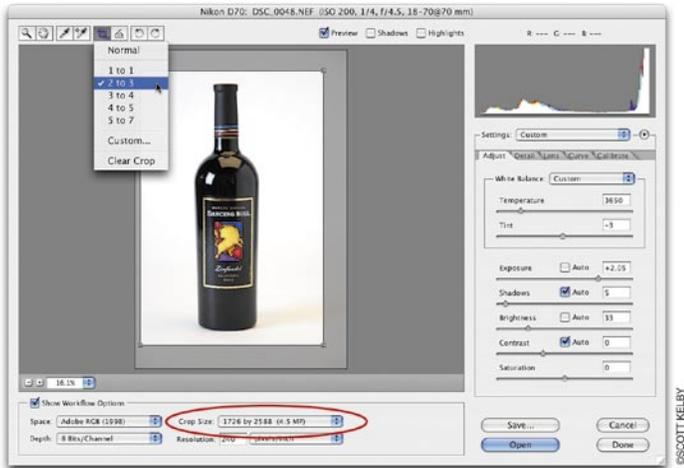

Cropping within Camera Raw

Photoshop CS2 is the first version to enable you to crop your images directly in Camera Raw.

Step One: Once your image is open in Camera Raw, click-and-hold the Crop tool in the Toolbox until a pop-up menu appears. Select the appropriate cropping specifications: Normal (standard "drag-it-where-you-want-it"), one of the ratio presets, or Custom.

Step Two: Click the Open button in Camera Raw to automatically crop the image to your specs and open it in Photoshop. Note: If you click the Done button in Camera Raw instead, the cropping border remains with the file, but the image itself isn't cropped—if you reopen the RAW file, you'll see the cropping border still in place.

Tip: You can crop photos simultaneously in Camera Raw. Click the Select All button (top left in dialog box) and then use the Crop tool to create your cropping border in the image preview area. This will put a tiny Crop icon in the bottom-left corner of the thumbnails.

Image Warping

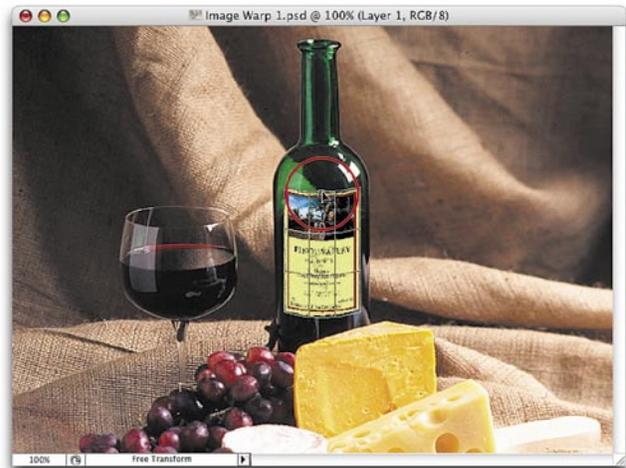

If you like the Warp Text feature, you'll love Image Warp! Adobe takes this technique to the next level by letting you stretch, bend, curl, and wrap images around any shape. You can customize the tool and easily create mock-ups, dummies, and other dimensional effects.

Step One: Open the photo that has an object that you want to map another photo onto. Then, open the photo you want to map onto that object.

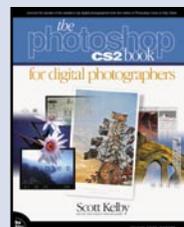

Step Two: Press V to get the Move tool and drag the photo onto the object image. Open Free Transform, Command-T (PC: Control-T), press-and-hold the Shift key, and scale the photo as needed. Click-and-drag within the bounding box to center the photo.

Step Three: While Free Transform is still up, Control-click (PC: Right-click) within the bounding box and choose Warp from the contextual menu of transformations. From the Warp pop-up menu in the Options bar, choose the applicable shape you wish to use. For example, if you were placing a label on a wine bottle, you would want to use the Arch option.

Step Four: You should see a grid over the photo (wine label). To tweak and perfect the shape, use the control point at the top center of grid and activate individual control handles via the Warp pop menu in the Options Bar (choose Custom). Points will appear at all the outer intersections, you can adjust them individually or you can simply grab the grid in the center and drag it around.

Step Five: When you have the photo (wine label) warped, press Return (PC: Enter) to lock in the warping. Note: For a more realistic finish, go to the Layers palette and lower the Opacity setting of the photo (wine label) layer to around 80%, this will give it natural highlighting.
