About the Authors

Bert Scalzo is a Database Expert for HGST (a Western Digital company) and was formerly at Dell Software as a member of the Toad dev team for 15 years. He has worked with Oracle databases for more than two decades. Mr. Scalzo's work history includes time at both Oracle Education and Oracle Consulting. He holds several Oracle Masters certifications and has an extensive academic background—including a BS, MS, and PhD in Computer Science, an MBA, plus insurance industry designations. Mr. Scalzo is also an Oracle ACE.

Mr. Scalzo is an accomplished speaker and has presented at numerous Oracle conferences and user groups, including OOW, ODTUG, IOUG, OAUG, RMOUG, and many others.

He has written several books and numerous articles, papers, and blogs for the Oracle Technology Network (OTN), *Oracle Magazine*, *Oracle Informant*, *PC Week* (eWeek), *Dell Power Solutions Magazine*, *The LINUX Journal*, LINUX.com, Oracle FAQ, and Toad World.

<http://bertscalzo.com/>

Dan Hotka is a Training Specialist and an Oracle ACE Director who has more than 37 years in the computer industry, and more than 31 years of experience with Oracle products. His experience with the Oracle RDBMS dates back to the Oracle V4.0 days. Dan enjoys sharing his knowledge of the Oracle RDBMS. Dan is well published with 12 Oracle books and well over 200 published articles. He is frequently published in Oracle trade journals, regularly blogs, and speaks at Oracle conferences and user groups around the world.

Dedication

To my past and present miniature schnauzers Ziggy, Max, and Dexter—the three most wonderful four-legged kids that any parent could ever have. ☺

And to my wife Susan who's always jealous of my many book dedications solely to the dogs...

Bert Scalzo, PhD

This book is dedicated to my grandson Riggs, without whom my family would not be the same. Here's to the next generation!

Dan Hotka

We Want to Hear from You!

As the reader of this book, *you* are our most important critic and commentator. We value your opinion and want to know what we're doing right, what we could do better, what areas you'd like to see us publish in, and any other words of wisdom you're willing to pass our way.

We welcome your comments. You can email or write to let us know what you did or didn't like about this book—as well as what we can do to make our books better.

Please note that we cannot help you with technical problems related to the topic of this book.

When you write, please be sure to include this book's title and authors as well as your name and email address. We will carefully review your comments and share them with the authors and editors who worked on the book.

Introduction

A complete rewrite of the popular but dated *TOAD Handbook*, this book covers the very popular Toad for Oracle database management and development tool. It covers all the popular and key features of Toad, including many features that are new additions to Toad version 12.5. Moreover, this book offers numerous Toad tips and tricks, with ample expert advice and techniques—without focusing on any particular version of the Oracle database. Readers should be able to identify and readily adapt these “best practices” to their daily use of Toad.

Who Should Read This Book

This book should benefit all Toad users. It is ideal for a wide range of users, from those who are new to both Oracle and Toad, to very sophisticated or experienced users of Toad. Furthermore, this book attempts to address the specialized needs for three key database personas: database administrators, database application developers, and data/business analysts. In truth, Toad has so many features and offers so many benefits that no one book can realistically hope to fully cover them all. Thus, each chapter focuses on a particular functional or task-related area, covering it in depth with illustrations, tips, and techniques from Oracle and Toad experts.

This book is ideal for the following types of readers:

- ▶ The power user who wants easy access to data, help with SQL, and help with occasional coding assignments
- ▶ The user who wants to increase his or her productivity while using the Oracle RDBMS

IN THIS CHAPTER

- ▶ Who Should Read This Book
- ▶ Why This Book Is Unique
- ▶ How This Book Is Organized

- ▶ The IT professional who is already familiar with Toad but needs help with its extended features
- ▶ The developer who wants to do something specific but cannot remember how
- ▶ Any Toad user who wants to learn how to take advantage of Toad's newly introduced features

Why This Book Is Unique

This book doesn't make assumptions about readers' prior Toad or Oracle administrative or development background, so it presents the full range of tips and techniques applicable to these tools. The main goal of this book is to illustrate the use of Toad and to serve as a handy reference for anyone using the Toad database tool. To this end, the book is liberally illustrated with working examples of all topics covered.

This book is intended to be a complete, single source of information, usage, tips, and techniques for the Toad tool. It focuses on the following topics:

- ▶ Toad installation and setup
- ▶ Development of PL/SQL and SQL statements and scripts in an easy-to-use and intuitive environment
- ▶ Tuning SQL and debugging PL/SQL
- ▶ Modeling any user's schema
- ▶ Routine and advanced DBA tasks
- ▶ Exporting of data into various formats
- ▶ Additional features such as ER diagrams, trace file analysis, tablespace management, object management, and the ability to add your own favorite editors and programs. This book includes a chapter on Toad as a SQL tuning tool, something Toad is very good at.

How This Book Is Organized

The chapters are organized as follows:

- ▶ Chapter 1, "Getting Started," discusses the various versions and editions of Toad, and how it is packaged and sold. This chapter also details the installation and prerequisites for the computing environment that will run Toad. This chapter has a nice section on using Toad for the first time. The goal of this chapter is to jumpstart your learning process and make you productive with Toad ASAP.
- ▶ Chapter 2, "Fast Track," is a fast track to customizing Toad at startup, navigating the menus, learning the key shortcuts, and customizing Toad for your personal preferences.

- ▶ Chapter 3, “Working with SQL,” is all about the SQL Editor and working with SQL. This chapter shows a number of ways of creating SQL without doing much typing at all. This chapter shows how to set up your own personal code shortcuts, and illustrates how to use the SQL Recall (SQL history). This chapter concludes with how to create SQL via mouse operations using Query Builder.
- ▶ Chapter 4, “Schema Browser,” covers saving, formatting, and reporting on data from about any data grid. The focus of this chapter is the Schema Browser and how to best configure it for your personal preferences, as well as how to work with the data in any data grid. This chapter concludes with a nice walkthrough of the FastReport feature built into Toad, a nice report writer.
- ▶ Chapter 5, “Working with Data,” finishes the discussion on working with data grids, showing the data relationships and how to see them, generating SQL from the relationships, and more.
- ▶ Chapter 6, “Working with PL/SQL,” is for the PL/SQL developer. Toad is rich with development features such as code templates, code snippets, and more. This chapter covers the PL/SQL Debugger and PL/SQL Profiler that are built into Toad.
- ▶ Chapter 7, “Miscellaneous Tools,” illustrates the team-building features built into Toad.
- ▶ Chapter 8, “Getting Started with Toad Automation,” explores using the Automation Designer or Toad’s own programming language to automate repetitive tasks.
- ▶ Chapter 9, “Database Administration,” is for the DBAs using Toad. This chapter covers the database health check, how to monitor sessions and databases, tablespace maintenance, reporting, and more. Toad is an excellent Oracle administration tool.
- ▶ Chapter 10, “Toad as a SQL Tuning Tool,” covers how to set up and use explain plans in Toad, illustrates useful hints, and reviews how to turn SQL Trace on/off via a number of mechanisms (for a session or for an individual SQL), and explores both the TKProf interface (the old and true character-mode trace analyzer) and Toad’s own trace file browser that allows you to quickly find the problem SQL.

We hope you enjoy using this book as much as we have enjoyed writing it.

Bert Scalzo

CHAPTER 3

Working with SQL

This chapter covers various aspects of the SQL Editor window, such as

- ▶ Various modes to compile and execute code
- ▶ Using Toad history for past SQL
- ▶ Enhancing the interface to best fit your needs
- ▶ Using little-known items within the SQL Editor
- ▶ Code templates
- ▶ Building SQL without typing

Editor Window

Dell Software has a single editor now for all types of code, including SQL and PL/SQL. This editor is the main interface to Toad and enables the execution of SQL and SQL scripts, viewing data, saving data into various formats, and more. The SQL is saved in a history. Toad saves on keystrokes in a variety of ways; you can develop working SQL with a minimal amount of key entry. Toad also makes it easy for you to rerun recent work (using the Rerun menu button; see Figure 3.1).

IN THIS CHAPTER

- ▶ Editor Window
- ▶ SQL Editor Output Area
- ▶ Object Describe
- ▶ Toad Insights
- ▶ Code Snippets
- ▶ SQL Recall
- ▶ Auto Replace
- ▶ Query Builder

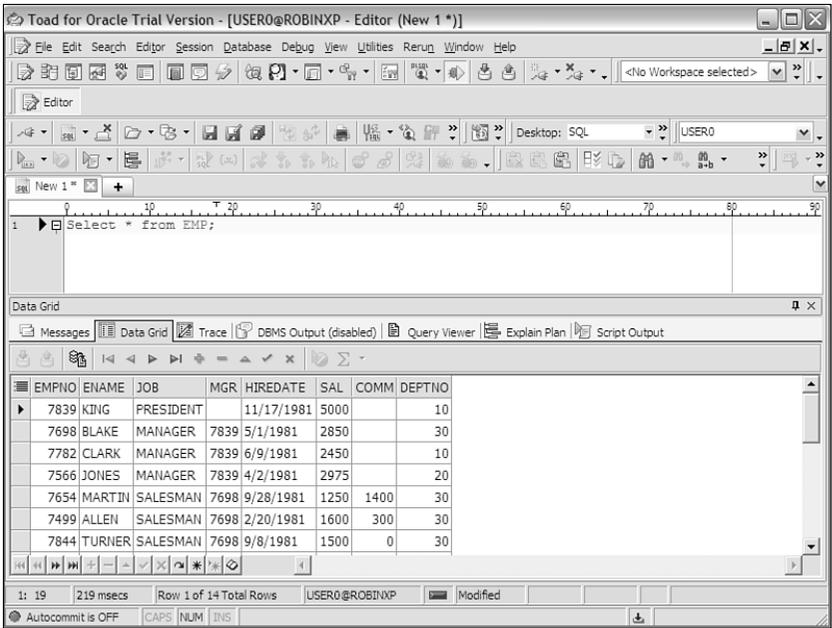

FIGURE 3.1 Toad SQL Editor panel

The SQL Editor is the main interface to Toad. Simply type in a SQL statement and click the green triangle execute button . You can also press F9. This sends the SQL statement that the cursor is on (or the highlighted SQL) to the Oracle database. If the query is successful, then the data or success of the statement will be returned and displayed.

The Editor button  makes opening additional Editor windows possible. This version of Toad enables you to open additional tabs in the Editor window. Simply right-click the tab just above the selected statement and select SQL or PL/SQL tab type. This opens another Editor window using the same database connection. Use the Editor button in the top-left row of buttons to open another Editor window, perhaps using a different connect string.

NOTE
 Hover the mouse over any button to see a brief description of what it does.

TIP

You typically have three ways to do most any function in Toad:

- ▶ Menu item
- ▶ Keystroke
- ▶ Function key

Activating a menu item shows whether there is a button (it will appear) and any keystrokes that you can also use to activate the feature.

The top toolbar (refer to Figure 3.1), called the standard toolbar, provides access to various Toad browsers, features, commit/rollback, and initiating additional connections. Right-click on any of these top toolbars and you can select the ones you wish to have visible. By closing the ones you don't use, Toad can perhaps have a larger Editor window. The window toolbar shows the active Toad windows. There are also toolbars for team coding, desktops, connection, jump search, and workspaces. You can change the color border per your needs. Dan uses red borders for SYS and SYSTEM accounts, and then a different color for each different Oracle database to which he connects. The next toolbar enables you to open code from the file system or from the database and also offers access to other features. You can right-click on these toolbars to show or hide the ones you don't work with. The bottom toolbar has the Execute, Execute as Script, Clear, and Halt buttons. The Execute button  will run all code in the Editor window. You can also just put the cursor on a SQL statement (if there are multiple SQL statements in the Editor window) and click this button. Toad will just execute the one SQL statement. Some people highlight the SQL they wish to execute. After execution, the Data Grid output tab will be populated. This technique works fine as well. The Execute as a script button  runs the contents of the Editor window as if it were using a SQL*Plus character-mode interface. There is a separate Script Output tab for the result of this type of execution.

The Halt button  stops the current SQL execution. It will un-gray as SQL is executing in Toad. This feature is also dependent upon Toad Options → Oracle → Transactions Run in Threads selected.

The Clear button (see Figure 3.2 at the cursor position) clears the contents of the SQL Editor window. One of the authors likes to simply open a new tab (right-click the tab, and select New Tab) and put each individual unit of work in its own tab. Use the + next to the existing open tab to open others. These tabs are associated with a single connection to the Oracle database. This approach makes it easy to rerun prior SQL statements, particularly when testing. This technique is also useful for PL/SQL code such as packages. Putting the package specifications in one tab and the package body in another tab keeps the two separate. The package body won't compile correctly if any issue exists with the specifications, as shown in Figure 3.3. Dan likes to work with package specifications and the body in separate tabs for this reason. This is a good technique to follow. Toad automatically puts the package spec and body in separate tabs when opening a package either from a file or from the database. This feature is controlled by Toad Options → Editor → Open/Save Packages/Types settings. You can choose this behavior or turn this feature off.

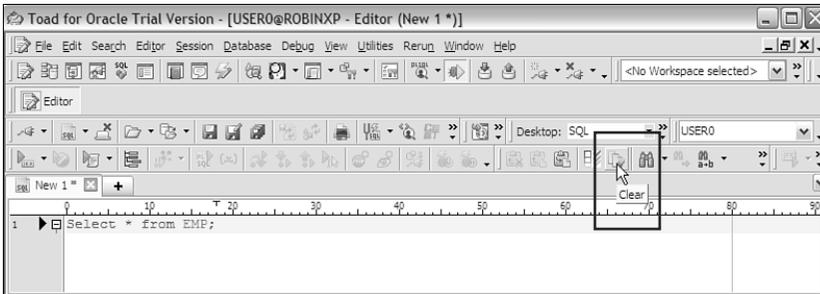

FIGURE 3.2 Clear button

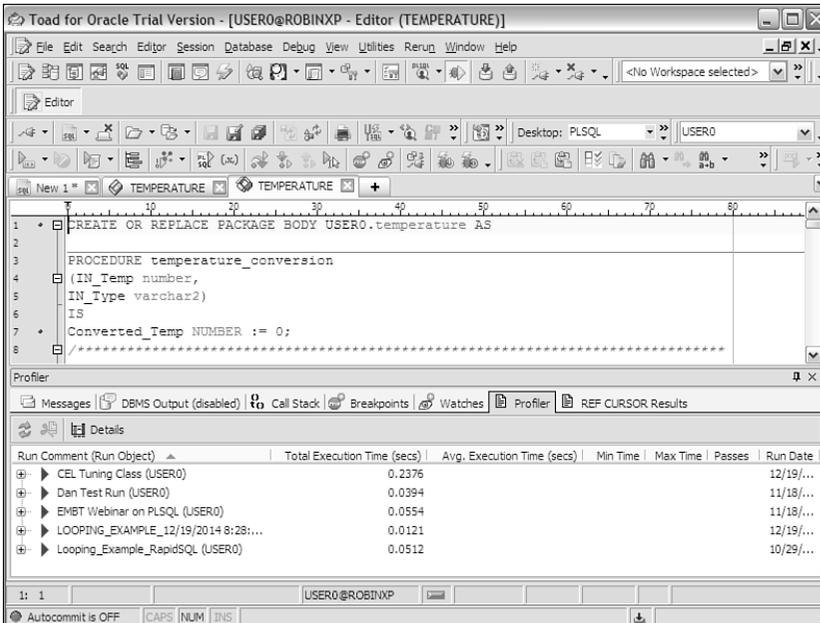

FIGURE 3.3 Toad with separate tabs for the package specification and body

TIP

You can also initiate multiple logins instead of using multiple tabs. Multiple logins can make moving data/objects between instances of Oracle a snap. Multiple tabs share the same database connection.

The toolbars are easy to configure. Right-click one to see the pop-up menu shown in Figure 3.4.

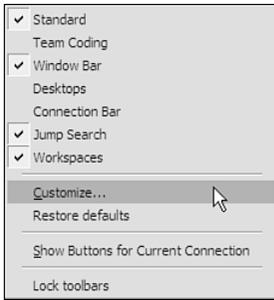

FIGURE 3.4 Configuring the toolbars

Notice the menu enables you to turn on and off the various toolbars. You can also configure the individual toolbars from here. You can delete unused buttons you find cluttering the toolbars, move buttons around, and add additional buttons. Figure 3.5 shows the toolbar configuration menu. The Toolbars tab enables you to turn toolbars on or off. The Commands tab enables you to add or delete buttons from each particular area of Toad. Drag and drop to move the buttons, remove the buttons, or add additional buttons. The Options tab enables you to turn on or off the mouse hover tips, change the size of the icons, and adjust how Toad stores your executed commands.

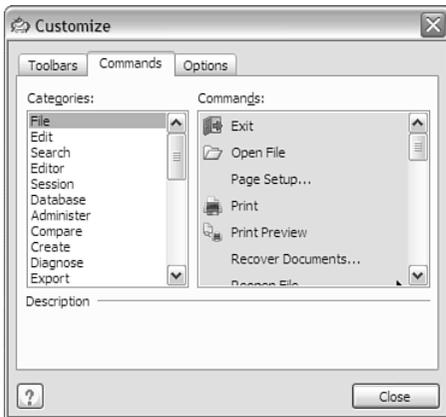

FIGURE 3.5 Configuring the toolbar buttons

Notice in Figure 3.4 that you can easily reset these options back to the Toad defaults.

TIP

One of the authors typically closes the Windows menu, and the Team Coding and Connections toolbars to give additional space to the editor windows.

SQL Editor Output Area

The data grid has a tool palette that enables the user to scroll up or down the returned rows, add rows, and delete rows (see Figure 3.6). Notice the light at the cursor along the bottom of the SQL Editor screen (see the cursor position in Figure 3.7). If this is red, then the data in this data grid cannot be changed and the commit/rollback/add/delete rows buttons will be grayed out. If the pseudo column ROWID was selected in the SQL, then this light will be green and the commit/rollback/add/delete rows palette will not be grayed out and the data can be changed.

FIGURE 3.6 Data Tool palette

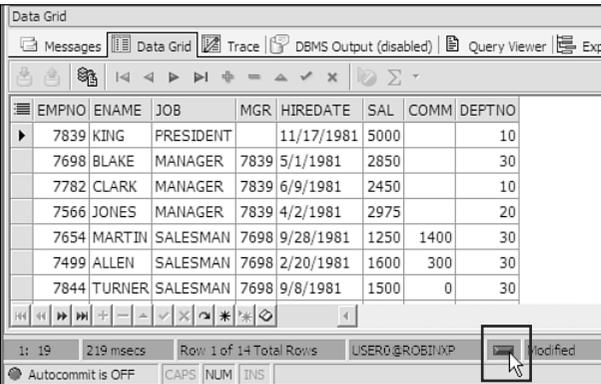

FIGURE 3.7 Toad data grid

WARNING

Toad only retrieves 500 rows at a time. In Toad11+, moving the scroll bar retrieves the next 500 rows. In older Toad versions, if you move the data scroll bar on the right-hand side, Toad will retrieve all the remaining rows. Be careful!

Many output tabs are available in Toad. These tabs usually automatically display when a request occurs for the data contained to be displayed, such as when you execute the PL/SQL profiler. In that case the Profiler tab should automatically appear. Figure 3.8 shows this list.

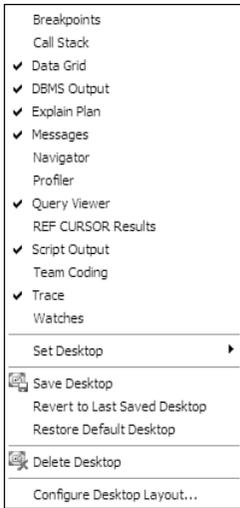

FIGURE 3.8 Available output tabs

You can easily display or hide these tabs. Right-click the tab line to see all the tabs available. Simply adjust per your needs. You can also right-click the editor panel and select Desktop from that pop-up menu to get the same list.

The Breakpoints, Call Stack, and Watches tabs are all associated with the PL/SQL Debugger (covered in Chapter 6, “Working with PL/SQL”). The Data Grid tab is associated with any SQL select statement execution. Data grids appear throughout Toad, and the options that are available for this data grid are also available for any data grid. The DBMS Output tab shows any DBMS_OUTPUT.Put_Line output from a PL/SQL routine. The Explain Plan tab (discussed later this chapter and again in Chapter 10, “Toad as a SQL Tuning Tool”) shows the SQL execution plan; it also has many display options. To populate this tab, click the Explain Plan button . The Messages tab shows any output from the executed SQL, including error messages (its real value). The Navigator tab displays the Navigator panel to the left of the Editor window. The Profiler tab is associated with the PL/SQL Profiler discussed in Chapter 6. The Query Viewer tab shows SQL and PL/SQL that was executed in the SQL window and some interesting statistics such as how long it took to execute. This information is useful for either rerunning that exact same SQL or when doing performance tuning (to easily compare one SQL execution with another). The REF CURSOR Results tab is also associated with PL/SQL execution. The Script Output tab shows character-mode output when the Run as Script button is clicked for execution. Team Coding illustrates others’ participation in coding of particular PL/SQL code and is covered in Chapter 7, “Miscellaneous Tools.” The Trace tab enables SQL statistics and/or SQL Trace files to be generated and displayed for this particular SQL statement. Notice that you can enable both Auto Trace and SQL Trace from this tab (see Figure 3.9). The

Trace tab is discussed in detail in Chapter 10. The remaining items on this menu deal with these tabs themselves—which ones appear when Toad starts up, where they appear—and this includes saving the changes for the next time Toad is started, as well as restoring the default settings from when Toad was originally installed.

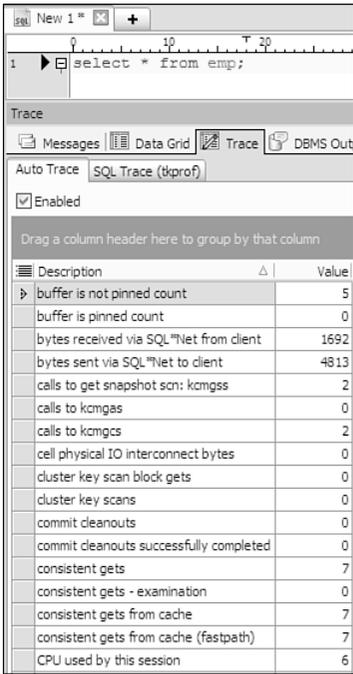

FIGURE 3.9 Toad Auto Trace

Clicking the Explain Plan button on the lower-left SQL Editor toolbar shows the Oracle explain plan for the SQL just executed. Right-clicking in this window enables the display to be adjusted.

The Auto Trace tab provides a variety of SQL runtime statistics. You can enable this feature using the check box or right-click in the editor window and select Auto Trace to enable, and then re-execute the SQL to populate the Auto Trace panel. Notice that you can also run a SQL trace on this particular SQL from the SQL Trace sub-tab. This feature needs the ALTER SESSION privilege; SQL trace is covered in detail in Chapter 10. Toad will run the SQL trace and either bring up the output using the TKProf Wizard or the Trace File browser, depending on which feature of Toad you have purchased.

NOTE

The Auto Trace, SQL Trace, and Explain Plan tabs are covered in detail in Chapter 10.

Object Describe

The F4, or Describe Object button, is one of the most versatile features of Toad. Simply put the cursor on a function, table, or other object in the editor window and press the F4 key, and detail about the object appears. The F4 or Describe window is useful for displaying object information and table information including data, syntax, and statistics. You can also access this screen by entering DESC <object *name*> in the SQL Editor.

Figure 3.10 shows a Describe Objects panel. You can call one up by pressing F4 with the cursor on the EMP table in the editor window. Notice the tabs across the center of the screen. Using those tabs you can easily access the other related objects, constraints, statistics, code, privileges, and more.

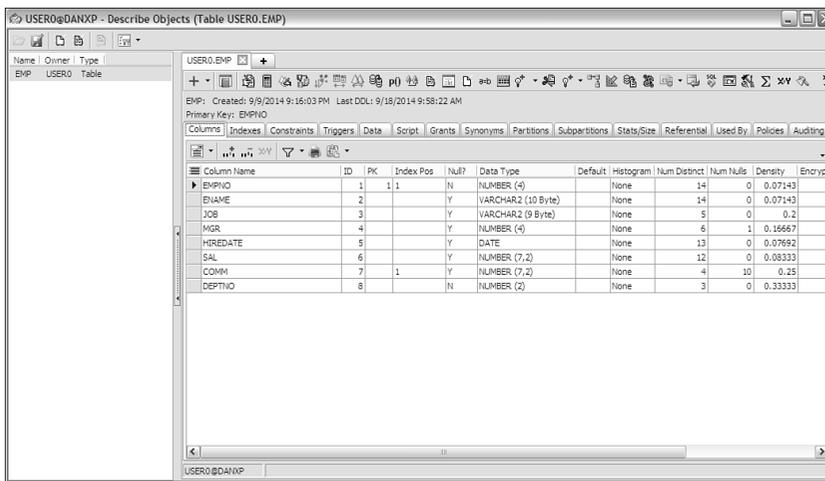

FIGURE 3.10 Describe Objects panel

You can drag and drop column names on the Columns tab onto the SQL window and show other information such as available indexes, constraints, triggers, and so on from this interface as well. This section covers the more important tabs individually.

TIP

You can drag and drop columns displayed in the Columns tab into the SQL window—SQL coding without typing!

The location of the Describe Objects panel can be adjusted. Figure 3.11 shows the buttons that control how the panel appears on the screen.

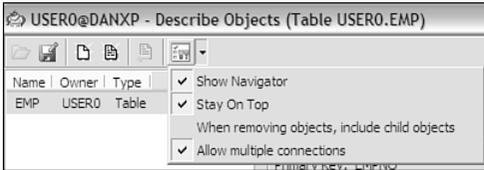

FIGURE 3.11 EMP Table Describe Objects panel buttons

NOTE

Toad 11 and newer put a new tab in this Describe Objects panel for each additional object being described. Older Toads open a new Describe Objects panel for each.

Buttons across the top of this panel (see Figure 3.12) control many items surrounding the object. Use the mouse and hover over any button to display a short description of its function. These buttons include:

- ▶ Add objects to this object
- ▶ Add to project manager (discussed later in this book)
- ▶ Alter/analyze/audit
- ▶ Compare
- ▶ Create another similar
- ▶ Create a script
- ▶ Show in various diagrammers
- ▶ Generate SQL (generates a select/insert/update/delete and puts it on the clipboard)
- ▶ Count/truncate

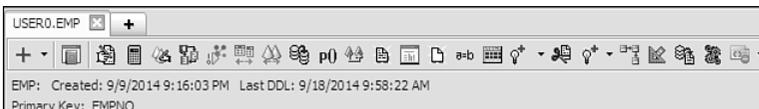

FIGURE 3.12 EMP Table Describe Tab buttons

WARNING

Toad is *not* one of those tools in which you should just click the button to see what it does. For example, if you have permissions to delete rows, the Truncate button will delete *all* the rows! Be careful out there!

The Script tab, shown in Figure 3.13, creates a script that could be saved and used to re-create the object. You can copy this script into a file and use it when creating a test environment for your application. Figure 3.14 shows the options available when you click the Options button on this script panel. Notice the adjustments you can make to the scripts. You can include the data, include drop statements, exclude schema owners (useful when setting up tables/objects for other users), and make other adjustments. Figure 3.15 illustrates the other content that you can include in the script output as well.

TIP

The author finds the ability to create scripts from this Scripts tab incredibly useful when creating a test environment for an application change.

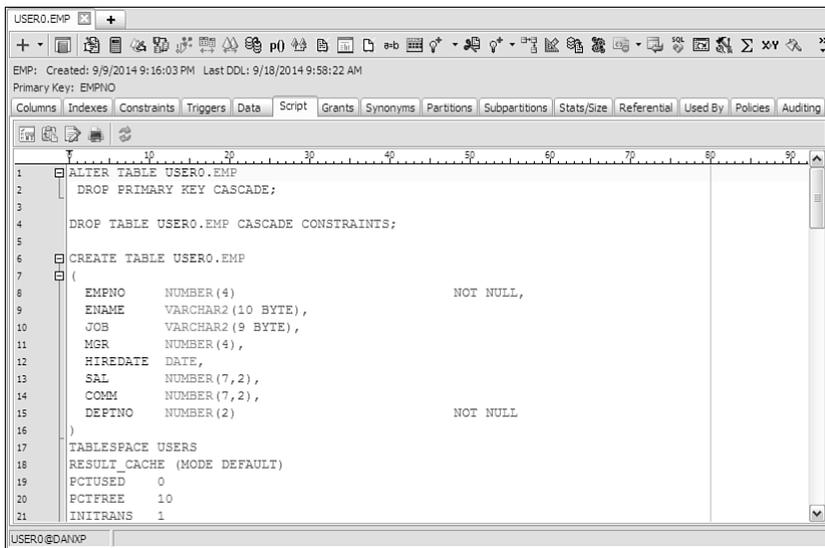

FIGURE 3.13 EMP Table Describe Object panel showing Script tab

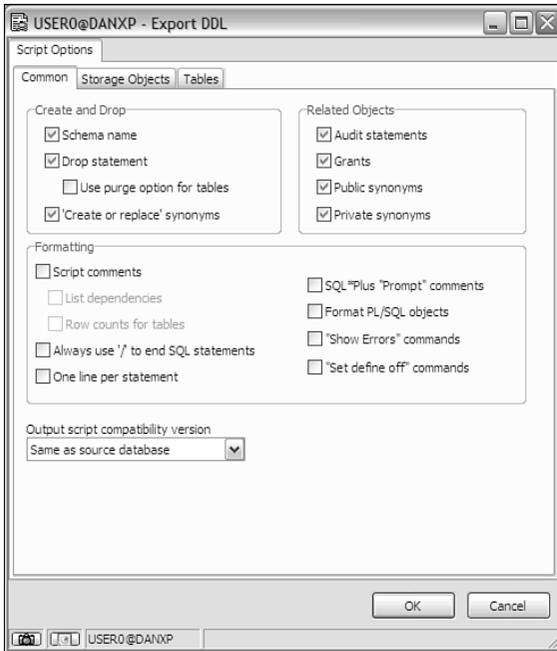

FIGURE 3.14 Script Tab Options panel

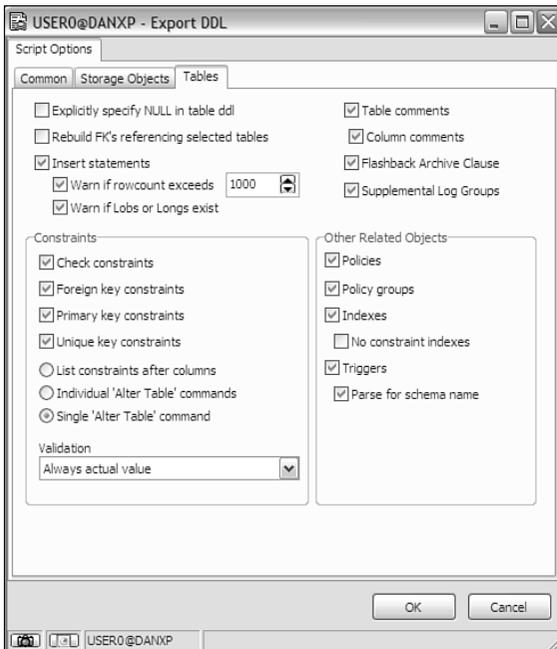

FIGURE 3.15 Script Tab Tables Option tab

The Export DDL button (shown in Figure 3.16) enables easy DDL syntax generation. Notice all the options available for optional syntax in the panel in Figure 3.17.

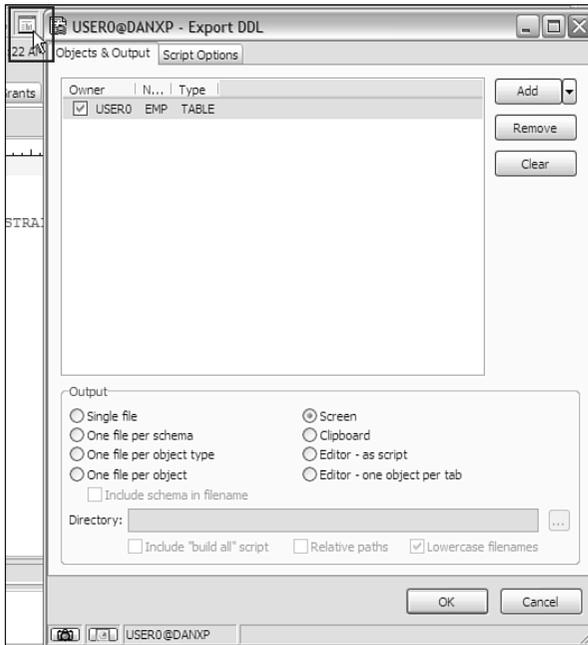

FIGURE 3.16 Export DDL panel

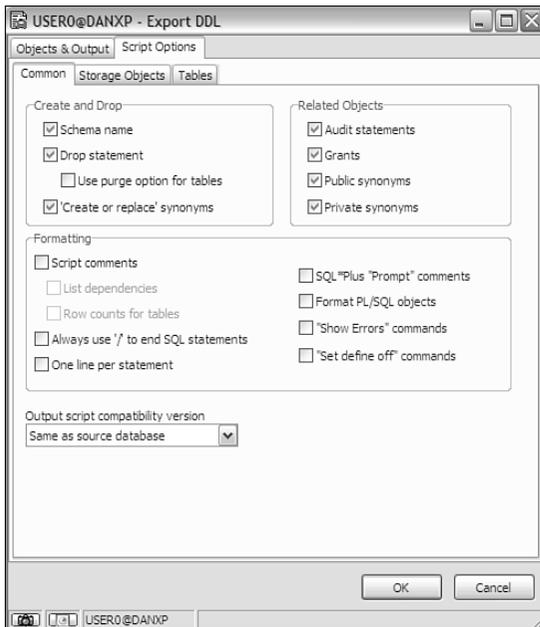

FIGURE 3.17 Export DDL Options panel

Figure 3.18 shows another data grid but just for the object selected. You can see the same navigation and data control buttons as discussed earlier for the SQL Editor Data Grid tab. Many features are common to all data grids and these are covered in detail in Chapter 5, “Working with Data.”

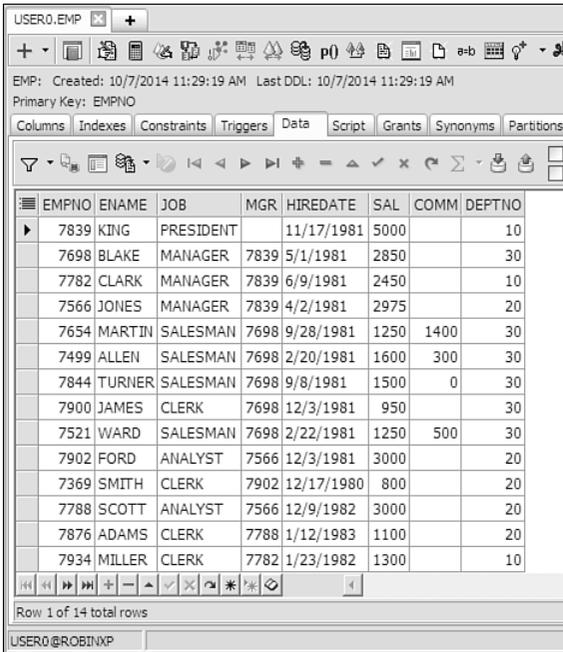

FIGURE 3.18 Data Grid panel

TIP

Be careful with large amounts of data on this panel. Use the Esc key to cancel any long-running data retrieval.

Clicking the Generate Statement button (see Figure 3.19) enables the easy creation of an Insert, Update, or Select statement from the visible columns of this data grid. Make your selection and then *paste* into the SQL Editor.

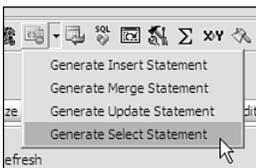

FIGURE 3.19 Generate Statement panel

Toad Insights

Toad provides easy creation of SQL. The previously mentioned Describe Objects panel enables you to drag and drop columns out of any table object into the SQL Editor. You can also enter the table name (or table alias) with a single period, the table name, another period, and partial leading column spelling, and Toad will pop up a box containing your table object columns and column attributes. Figure 3.20 shows a table with just a single period.

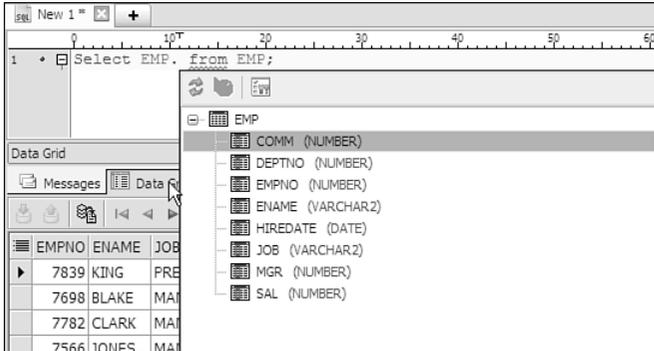

FIGURE 3.20 Toad Insights pop-up panel

You can double-click a column in this pop-up window, or multiple select using the mouse and either the Shift (list of items) or Ctrl buttons (specific items in the list) and then press the Enter or Return key to add the items to your code at the current cursor position. Notice in Figure 3.21, three columns were selected, and Toad qualified each with the table name! If you are utilizing table aliases, Toad remembers these and will qualify your code correctly.

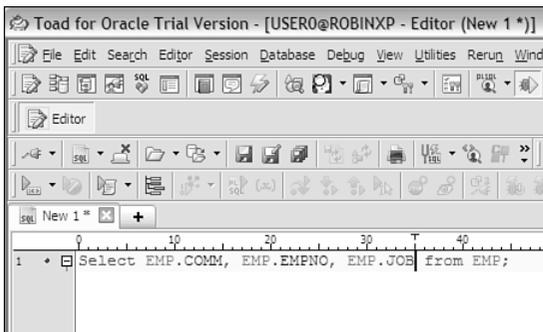

FIGURE 3.21 SQL Editor after using Insights

Notice earlier in Figure 3.20 that the items appearing in the Insights panel are in alphabetical order. One of the authors prefers the order as they appear in the object. Notice the Options button on the Insights panel. You can also access this area via the Configure Toad Options button on the top toolbar.

Figure 3.22 shows the Toad Insights configuration options. Notice that you can define the objects that this feature works on along the top. The center part of this screen allows you to

- ▶ Turn off the feature
- ▶ Cache the results (default)
- ▶ Display as text
- ▶ Sort the list (the author prefers to turn this off)
- ▶ Delay the popup (handy for those of us who type slowly...)

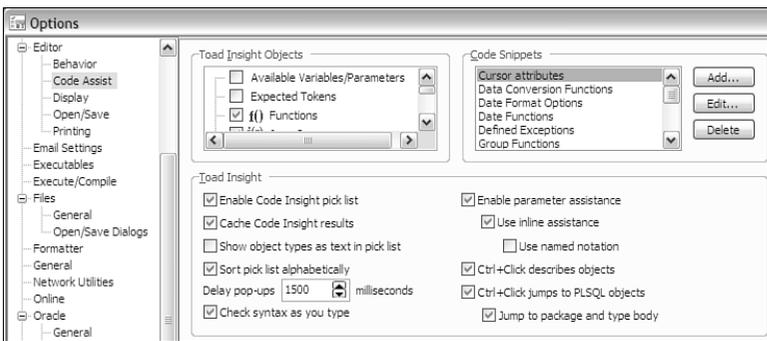

FIGURE 3.22 Insights Configuration panel

You can see some other items (discussed in Chapter 6) such as the Enable parameter assistance (sometimes the author turns this off as it can slow down PL/SQL coding), and some other built-in keystroke assistance.

Code Snippets

Toad contains bits of code called code snippets. These snippets contain most of the SQL functions, date formats, hints, and other bits of SQL and PL/SQL code that are of interest to the Oracle developer. Toad configuration options make it possible for additional items to be added or existing items to be changed.

To see the Code Snippets panel choose View → Code Snippets. The panel then appears and auto hides along the right side of Toad (see Figure 3.23). The push pin button can make the panel remain visible on your desktop.

FIGURE 3.23 Code Snippets panel

You simply drag and drop the code pieces from this panel to your code.

Figure 3.24 shows the various categories for the snippets. There are snippets for date formatting, various function templates for almost anything, and even SQL Optimizer hints (discussed some in Chapter 10).

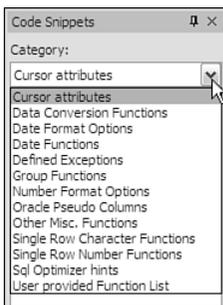

FIGURE 3.24 Code Snippets code categories

These snippets are configurable as well. Click the Configure Toad Options button (or access via the menu using View → Toad Options) and visit the Editor → Code Assistant panel as shown in Figure 3.25. This panel enables you to either clean up the categories you will never use, or better yet, add your own custom code snippets that you can easily add to your code via drag and drop.

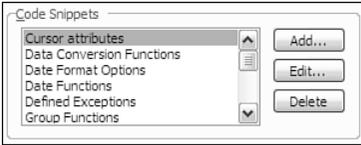

FIGURE 3.25 Configuring code snippets

SQL Recall

Toad saves all the work that was done in any of the editor windows.

ALT+Up Arrow and Alt+Down Arrow walk through this storage area. Choose View → SQL Recall or press F8 (see Figure 3.26) to open the interface shown in Figure 3.27.

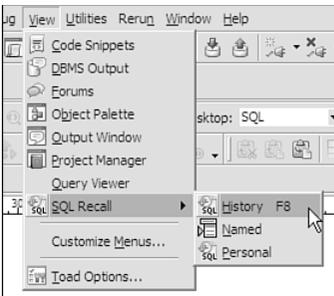

FIGURE 3.26 Accessing SQL Recall

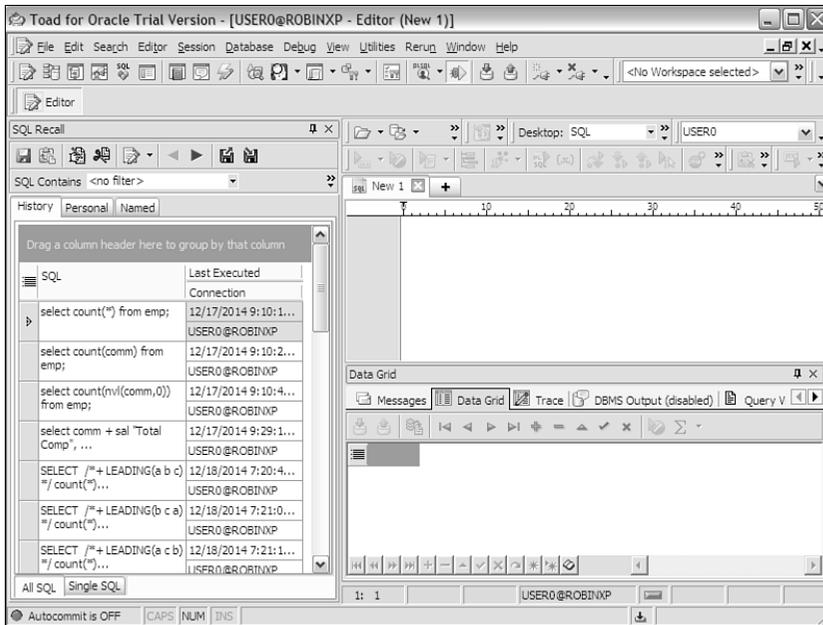

FIGURE 3.27 SQL Recall panel

Notice that the SQL Recall panel shows up as an autohide panel on the left side of Toad. You simply double-click a SQL statement in this panel and Toad will open a new tab and put the SQL in it.

TIP

One of the authors uses this SQL Recall during SQL tuning. If a prior SQL statement worked better, then it is easy to find and revisit.

This version of Toad enables the SQL to be moved to the Personal tab or the Named tab. Simply click the Edit Selection button in the SQL Recall window, and then select the Personal or Named option from the Type drop-down menu.

The buttons on the top of this panel (see Figure 3.28) enable you to do the following:

- ▶ Save selected SQL to a file
- ▶ Copy selected SQL to the clipboard
- ▶ Edit the selected SQL (allows for the SQL to be added to the Personal or Named tabs, which makes finding SQL easier, perhaps)

- ▶ Delete from the SQL Recall
- ▶ Load into the SQL Editor (Append, New Tab, or Replace into current tab)
- ▶ Navigation buttons
- ▶ Export/Import all the SQL (useful when updating Toad or moving to a new computer)

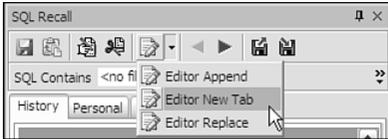

FIGURE 3.28 SQL Recall panel buttons

The Configure Toad Option → Editor → Code Assist SQL Recall settings (see Figure 3.29) control how many SQL statements are saved (max is virtually unlimited) and which SQL will be saved (all, or just valid ones). The Save Only Valid Statements option saves only the successful SQL, enabling more SQL to be saved. Typically, programmers are only interested in the SQL statements that didn't have syntax errors.

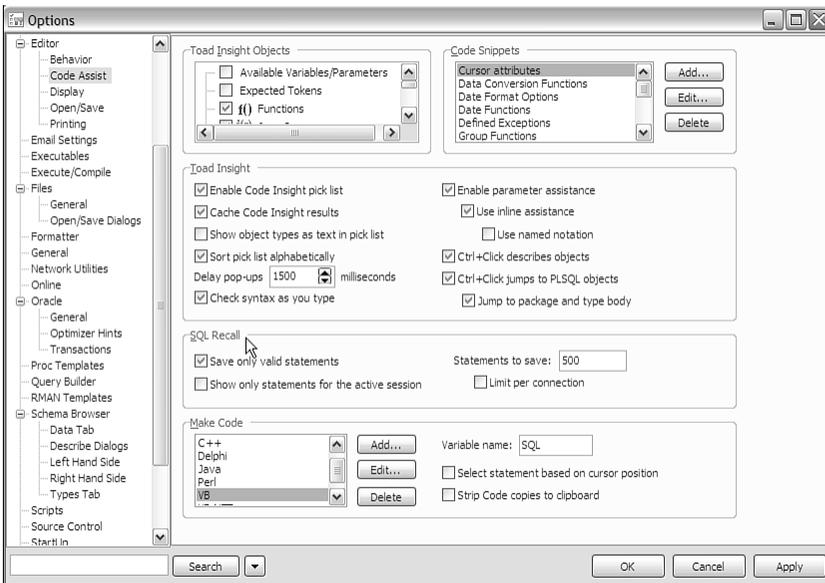

FIGURE 3.29 SQL Recall options

Auto Replace

Auto replace is like a spell checker; in fact, this feature actually does correct some spelling errors as well as correct obsolete code. This feature is activated via the space bar. It takes the last item entered since the prior space bar and compares it to a list. If the text is found in the list, the auto replace item is automatically substituted.

This feature is nice for long column names perhaps (although Toad Insights is a better mechanism for this), but it is used more for commonly entered items such as `sf` for `SELECT * FROM` or `pl` for `DBMS_OUTPUT.PUTLINE()`;

Chapter 6 discusses a way to use existing code templates and how to add your own.

In an editor window, type in “teh” and when you press the space bar, it will be corrected quickly to “the.” The space bar activates the check. If an item is in the Auto Replace panel, it is substituted.

To remove some auto correct items or to add your own (a good place to add any coding shortcut!), choose **View** → **Toad Options**, visit **Editor** → **Behavior**, and click the **Auto Replace** button on the lower-right part of the **Behavior** panel.

NOTE

Notice all the items that you can control in an editor window from this **Behavior** panel.

TIP

Dan uses this feature to code his own coding shortcuts.

This button opens the dialog in Figure 3.30. Notice the “teh” in the left side and the “the” in the right column.

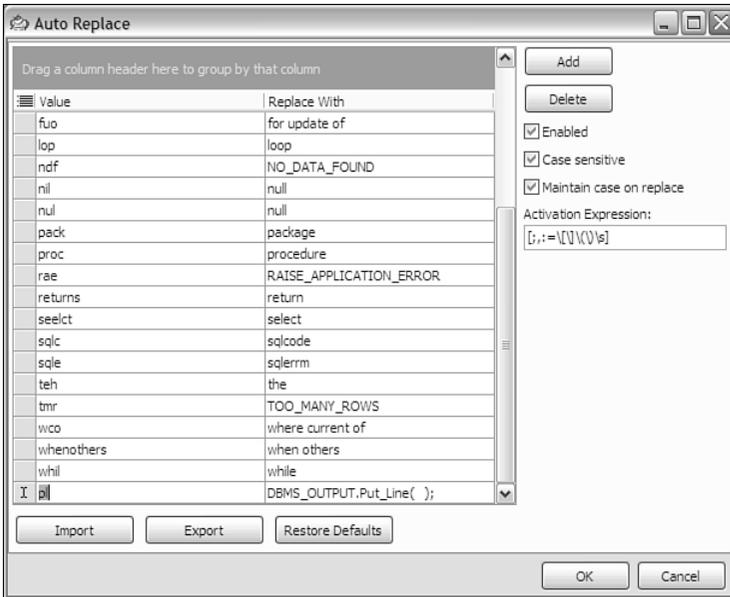

FIGURE 3.30 Adding an Auto Replace correct item

To add your own code assistants, click the Add button and fill in the grid as shown in Figure 3.30. One of the authors uses `DBMS_OUTPUT.Put_Line` frequently, so he wants a `pl` shortcut for it. Figure 3.31 shows the output when `pl` is entered and the space bar is tapped.

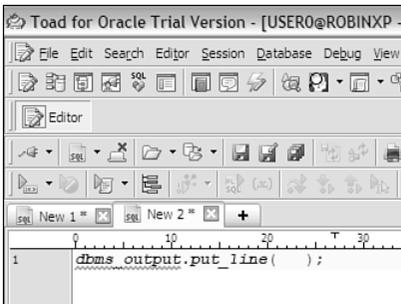

FIGURE 3.31 Auto Replace used for coding shortcuts

Query Builder

Toad has a nice Query Builder feature. This feature enables SQL code to be built using mouse operations. This feature is excellent for power users, analysts, and managers using Toad to create reports and access data but who have little knowledge of the SQL language.

dragging a column of interest from the canvas object and drop it on the WHERE clause. This feature works for the other items in the left panel as well. If the operation is a valid request, a wizard will appear to finish the syntax.

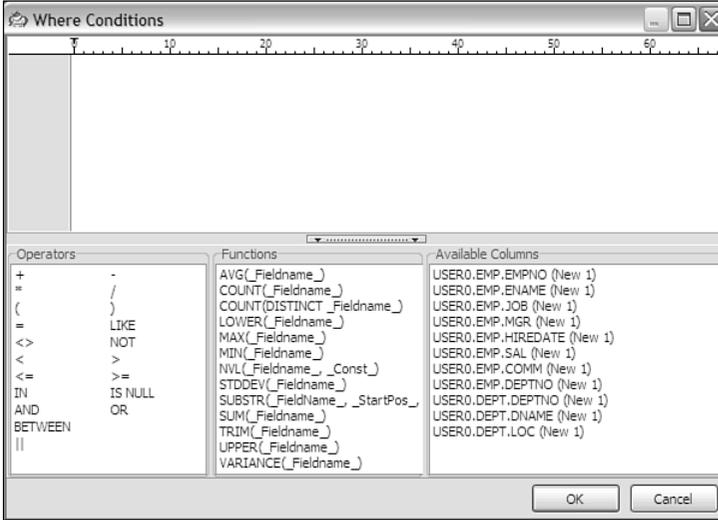

FIGURE 3.34 Query Builder using the Where item

Notice in Figure 3.35 that some columns were selected in the EMP and DEPT tables in the canvas and that the syntax was adjusted automatically. Also notice that the SQL syntax is using ANSI joins. Query Builder is an excellent tool for converting from either ANSI SQL to standard Oracle SQL or vice versa! Click the Ansi Join Syntax button, shown by the cursor in Figure 3.35, and you get the SQL in Figure 3.36!

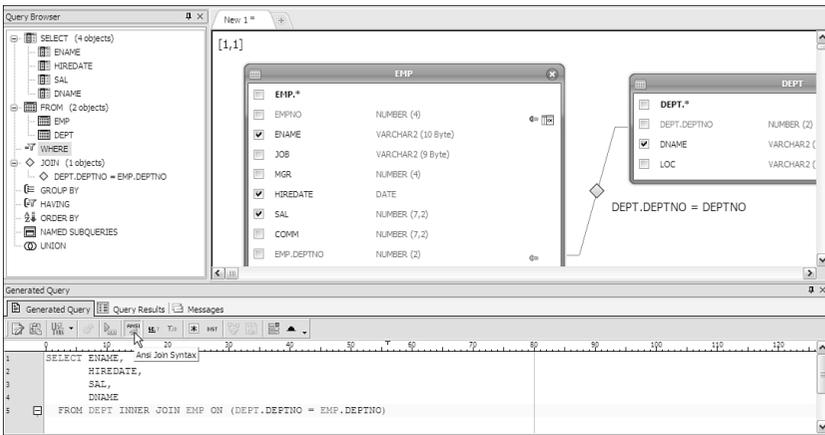

FIGURE 3.35 Query Builder ANSI SQL

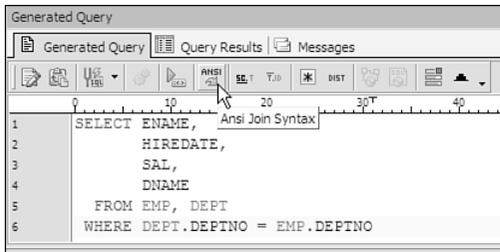

FIGURE 3.36 Query Builder Oracle SQL

Figure 3.37 shows the Generated Query panel control buttons. The first two buttons enable the generated SQL to be copied to either the editor (a new tab) or to the clipboard. The SQL Optimize button is a purchased feature of Toad (it enables the SQL to be automatically tuned). The Execute Query button will run the SQL from the Query Builder interface and populate the other two tabs present. The Add Table name button enables all the columns to be qualified. The next two buttons make it possible for either an * or the distinct clause to be added to the generated SQL.

FIGURE 3.37 Generated Query Panel control buttons

The Update Diagram and Update SQL can be useful buttons. You can make changes to the SQL via typing or you can paste a SQL statement into this generated SQL area and click the Update Diagram button, and the diagram in the canvas will be updated. Likewise, you can make changes to the diagram in the canvas and click the Update SQL button, and the changes will be made to your generated SQL. The Ansi button is a toggle; it will rewrite your SQL using ANSI join syntax if clicked. The Add Schema Name to Tables and Add Table Names to Column buttons are also toggle buttons. If clicked down, the SQL text will be adjusted accordingly. The final two buttons (Run Query in Threads and Allow Modify Query Results) pertain to how you would like to execute the SQL and possibly have the ability to change results from within the Query Builder environment.

You can add your own subqueries and calculations. There are right-click options under each object on the canvas, different options when right-clicking the object header on the canvas, and others. Calculations are easy to add by either

- ▶ Right-clicking the select line on the left Query Builder panel and selecting Add New Expression Column as shown in Figure 3.38.
- ▶ Adjusting the text in the Generated Query and clicking the Update Diagram button.

Options for each of the other items appear in this left panel as well. Just right-click and check out the various options. Right-clicking the columns on the canvas enables column aliases to be added. Right-clicking the table name enables an alias to be defined. Remember that a button on the Generated Query panel can add the table name or alias to all the columns in the SQL (a good idea).

There isn't any SQL that cannot be built using Query Builder. Figure 3.38 shows a calculated column, `sal * 1.1`, being added to the query.

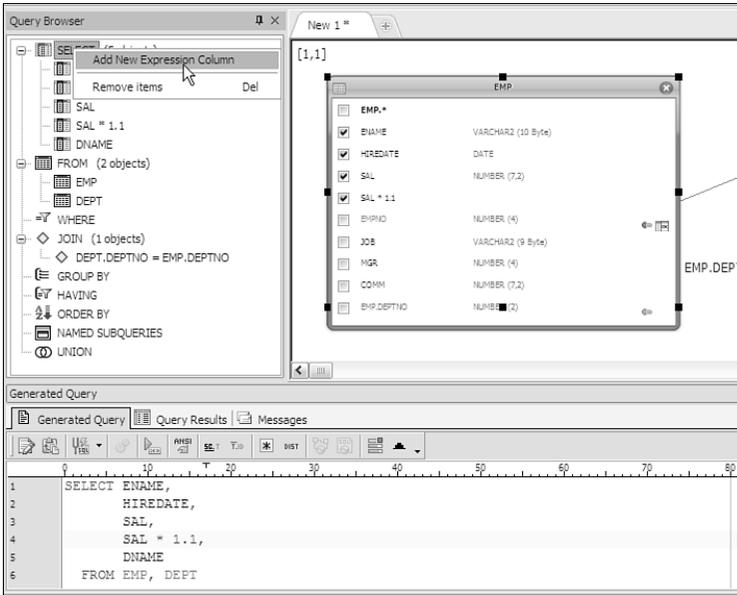

FIGURE 3.38 Adding calculations using Query Builder

Summary

This chapter covered various aspects of the main SQL Editor window. It is easy to build SQL, using the describe function and code snippets. You can enhance Toad for your own coding style using Auto Replace. Toad remembers the SQL that it has worked with. This chapter also covered the Query Builder, a useful tool for those new to Oracle but who have a need to access data within the Oracle RDBMS.
