Printed and bound in the United States of America

Acknowledgments Love and humble thanks to my wife Keri, son Jonah, and daughter Zinnia for their support and patience throughout the writing of this book.

Special thanks to all of the talented musicians who provided material for use in this edition of the book:

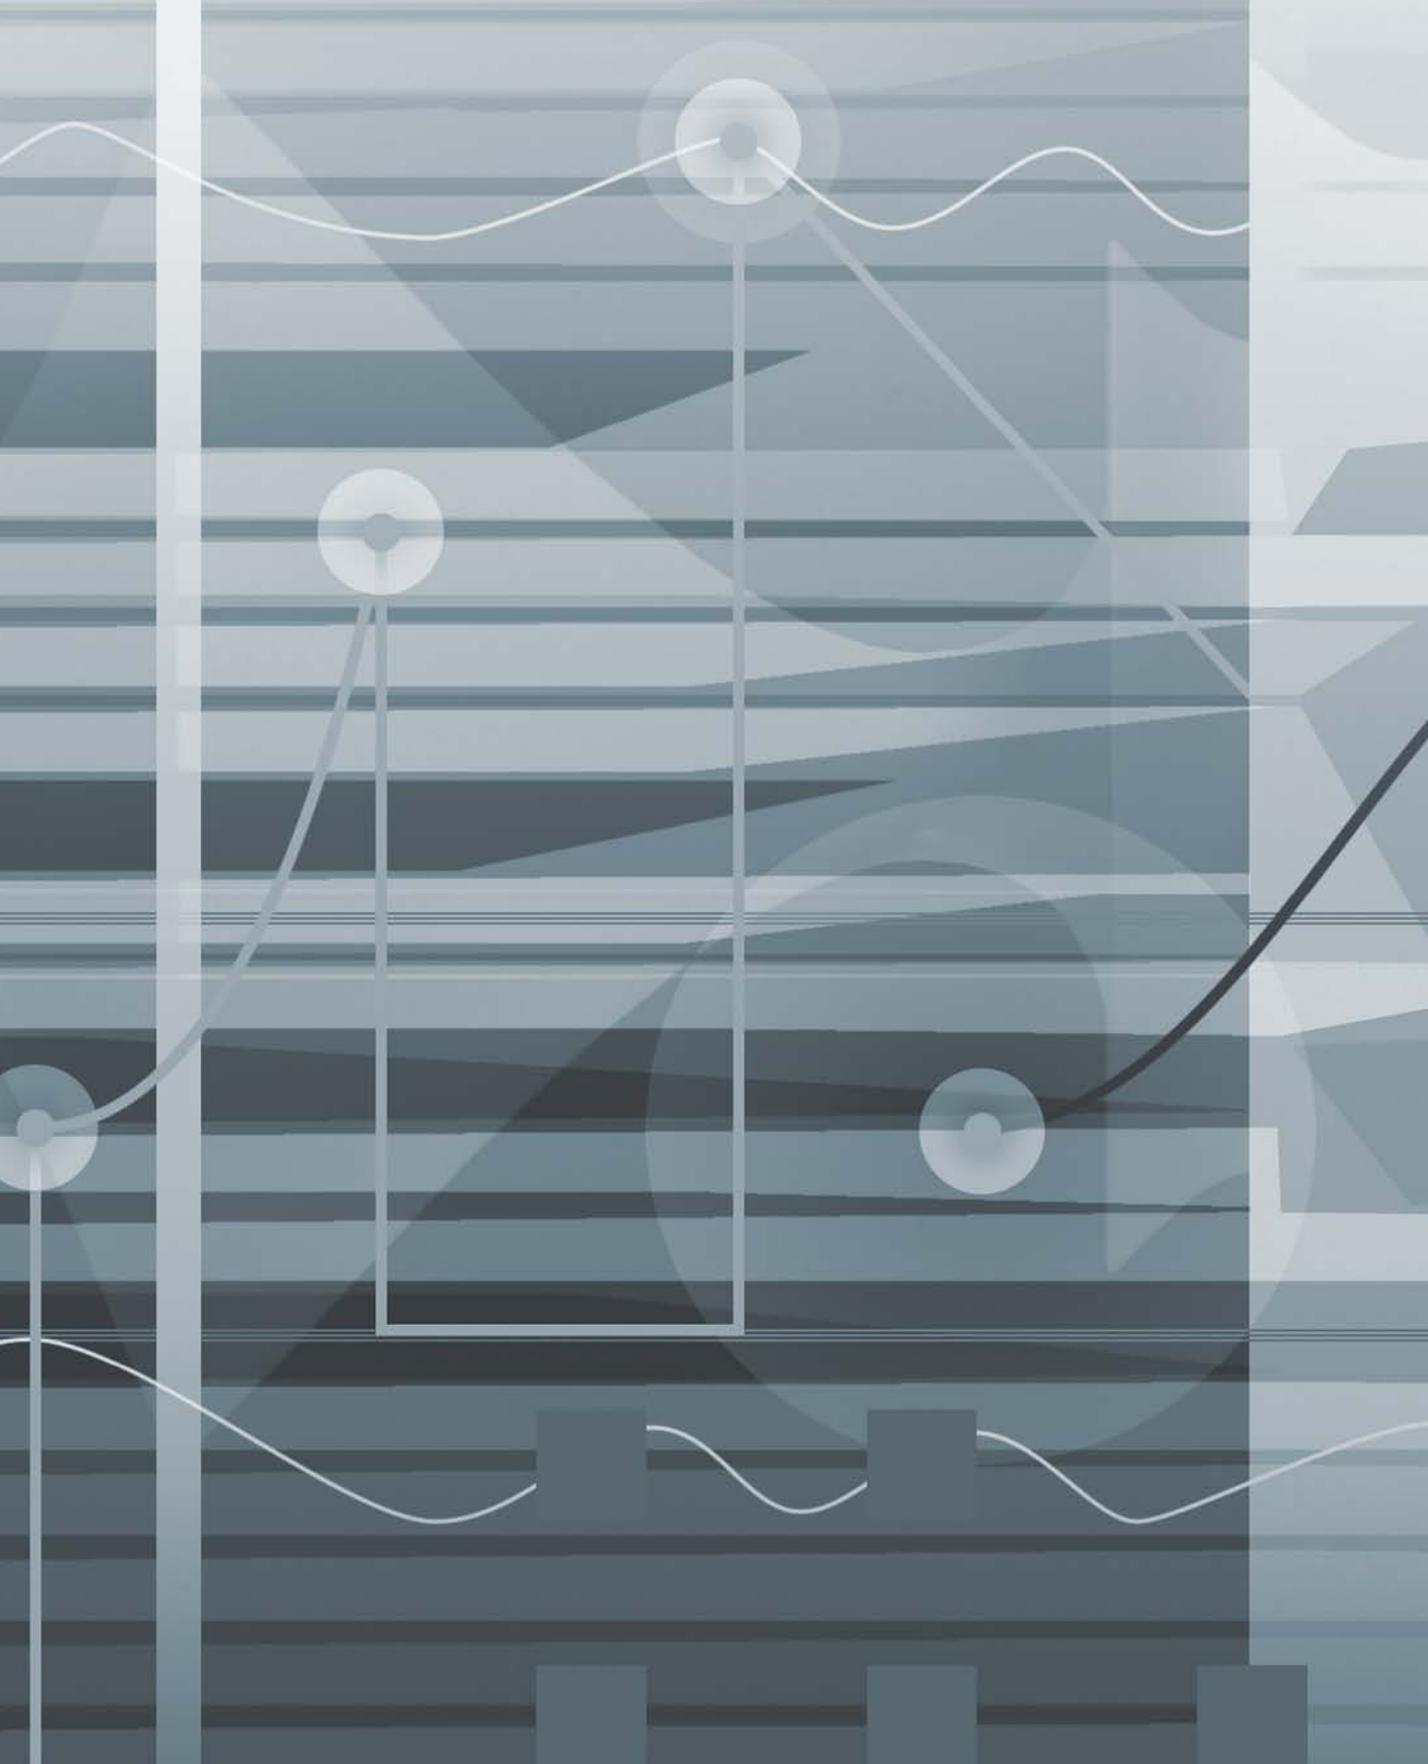

Harrison “Polo” Hedriana and The Colonel’s Men for their song “Midnight Wonder”

Grant Levin for his composition “A Blues for Trane”

Rocky Winslow and Randy McKean for playing on “Georgie the Spider”

Steve Martin for the use of the “2nd Impressions” footage

Caesar Filori and Wideband Network for providing “Anatomy of a Human Bomb”

Creating Your Own Sounds with Software Instruments

Lesson 3	Synthesis with the ES2 Synthesizer.....	81
	Understanding the User Interface.....	82
	Exploring the Oscillator Waveforms.....	83

	Using Oscillator Modulation to Create Interesting Sounds . . .	88
	Sculpting Your Sound Using the Filters	92
	Using Modulation	98
	Exploring the Output/Processing Section	113
	Lesson Review	115
Lesson 4	Sampling with the EXS24	117
	Creating Sampler Instruments	118
	Using the EXS24 Instrument Editor	120
	Creating Loop Points	125
	Using the Parameter Window	130
	Creating Multiple Zones from Region Transients	132
	Using Filters and Modulation to Process the Sound	136
	Using Groups	139
	Routing Individual Sounds for Processing	143
	Lesson Review	147
Lesson 5	Sound Design with Sculpture	149
	Understanding the User Interface	150
	Understanding the String	151
	Using Objects in Sculpture	153
	Adjusting the Pickups	157
	Processing the Sound	158
	Using Modulation in Sculpture	159
	Saving and Trying Presets	162
	Lesson Review	163
Lesson 6	Building Drum Sounds with Ultrabeat	165
	Selecting Sounds in the Assignment Section	166
	Exploring the Sound Generators	168
	Processing with the Filter and Bitcrusher	179
	Creating Drum Patterns with Step Sequencing	181
	Automating Parameters in Step Mode	188
	Lesson Review	192

Editing

Lesson 7	Working with the Arrangement	197
	Navigating the Arrangement.	198
	Using Markers	206
	Saving Arrangements as Alternative Files.	216
	Using Global Edits	218
	Comparing Arrangements.	231
	Lesson Review	232
Lesson 8	Advanced Audio Editing	235
	Smoothing Transitions with Crossfades	236
	Fixing Clicks in the Audio File Editor.	242
	Creating New Parts from Existing Ones	245
	Editing with Mixer Groups	255
	Repairing Drums with Marquee Transient.	265
	Lesson Review	277
Lesson 9	Advanced MIDI Editing	279
	Using Aliases	280
	Working with Region Parameters.	283
	Selecting MIDI Events for Editing	300
	Using MIDI Transform Functions	302
	Separating MIDI Events.	313
	Lesson Review	315

Mixing

Lesson 10	Managing the Mix	319
	Importing Channel Strips and Data.	320
	Working with the Mixer.	322
	Creating Production Notes	329
	Panning Stereo Tracks	331
	Switching the Contents of the Plug-in Window.	334
	Changing Plug-in Locations	337
	Using a Plug-in's Extended Parameters	338

	Using Mixer Groups	339
	Lesson Review	346
Lesson 11	Controlling Signal Flow	349
	Using Side Chain Effects	350
	Positioning Sends Pre or Post Channel Strip Controls	356
	Labeling Your Audio Interface's Inputs and Outputs.	364
	Incorporating External Effects Processors	367
	Bouncing in Place	371
	Lesson Review	376
Lesson 12	Controlling the Mix	379
	Editing Automation	380
	Applying Automation to Multiple Tracks at Once.	390
	Using Control Surfaces.	398
	Lesson Review	415
 Advanced Topics		
Lesson 13	Working with Surround	419
	Configuring Logic for Surround.	420
	Mixing in Surround	423
	Using Surround Effects	433
	Checking the Surround Mix	441
	Downmixing	444
	Bouncing the Surround Mix	446
	Lesson Review	448
Lesson 14	Real-time MIDI Processing	451
	Processing MIDI with MIDI Plug-ins	452
	MIDI Processing in the Environment	458
	Navigating in the Environment.	458
	Creating Environment Objects	462
	Creating Signal Chains.	475

See last page of this eBook for instructions on downloading your lesson files.

Getting Started

We are lucky to live during one of the most exciting periods in the history of the music production industry. Just a few years ago, you would need a studio filled with synthesizers, hardware effects processors, mixing consoles, and expensive multitrack tape machines to accomplish what you can now produce in a small project-based environment with a computer, an audio interface, and the right software. It's a good time to be a musician.

Apple Pro Training Series: Logic Pro X Advanced Audio Production: Composing and Producing Professional Audio is intended to help experienced composers, arrangers, and producers enhance their current Logic skills while working with real projects based on real-world scenarios.

You'll learn how to accelerate editing tasks and increase the overall efficiency of your production workflow. You'll refine your mixing techniques, manipulate tempo and pitch, create notated parts and scores, mix for surround sound, and develop music and audio tracks for video and film. You'll unlock the limitless potential of the groundbreaking software instruments in Logic by creating your own sounds from scratch.

Whether you're tweaking a song structure, applying effects processing, or editing audio and MIDI tracks, this book explains insider techniques to make your time with Logic Pro X more productive and creative.

The Methodology

This book is written for users who already have a working knowledge of Logic Pro. (Beginning or less-experienced Logic users should read *Apple Pro Training Series: Logic Pro X 10.1: Professional Music Production* by David Nahmani (Peachpit Press). Composers, audio engineers, and music producers currently working with Logic Pro will have the most to gain from this book.

The book is divided into six sections:

- ▶ Lesson 1 lays a foundation by helping you customize your Logic workflow. You'll create an environment designed to increase efficiency well after you've completed the exercises in the book.
- ▶ Lesson 2 reveals the deep Logic feature set for manipulating time and pitch, including Flex Time and the new Flex Pitch feature.
- ▶ In Lessons 3 through 6, you'll create your own sounds using the most advanced software instruments in Logic: ES2, EXS24 mkII, Sculpture, and Ultrabeat. Gaining an understanding of these powerful synthesizers and samplers will add a wealth of musical resources to your future sessions.
- ▶ In Lessons 7 through 9, you'll shape your tracks into an arrangement. Using the MIDI and audio editing tools, you will refine the sound and structure of your composition, correcting production problems and making the most of your best takes.
- ▶ A composition is only as good as it sounds, which makes mixing and mastering your arrangement an essential part of the creative process. Lessons 10 through 12 guide you in taking your composition to the final level. You'll use the Logic Pro Mixer, automation, control surface support, and effects processing to bring your creative output to highest degree of production quality.
- ▶ For many projects, Logic Pro will be an all-inclusive working environment that carries composers and producers from musical idea to final recording, from manuscript paper to the big screen. Lesson 13 provides a foundation for developing your surround sound mixing skills by using Logic's extensive surround support. In Lesson 14 you'll creatively process MIDI data both with MIDI plug-ins and by creating objects in the Environment. Lesson 15 shows you how to use Logic Pro's extensive notation capabilities to create musical parts and scores. Finally, in Lesson 16 you'll explore Logic Pro's power as a film and video scoring tool.

System Requirements

Before beginning to use *Apple Pro Training Series: Logic Pro X Advanced Audio Production: Composing and Producing Professional Audio*, you should have a working knowledge of your computer and its operating system. Make sure that you know how to use the mouse, navigate standard menus and commands, and also open, save, and close files. If you need to review these techniques, see the printed or online documentation included with your system.

For the basic system requirements for Logic Pro X, go to www.apple.com/logic-pro/specs.

Preparing Your Logic Workstation

The exercises in this book require that you install Logic Pro X along with its default media content. If you have not yet installed Logic, you may purchase it from the App Store. When your purchase is completed, Logic Pro X is automatically installed on your hard drive.

All the instructions and descriptions in this book assume that you installed Logic Pro X on a Mac without any legacy Logic media, and that you downloaded all the additional media except for the Legacy and Compatibility content.

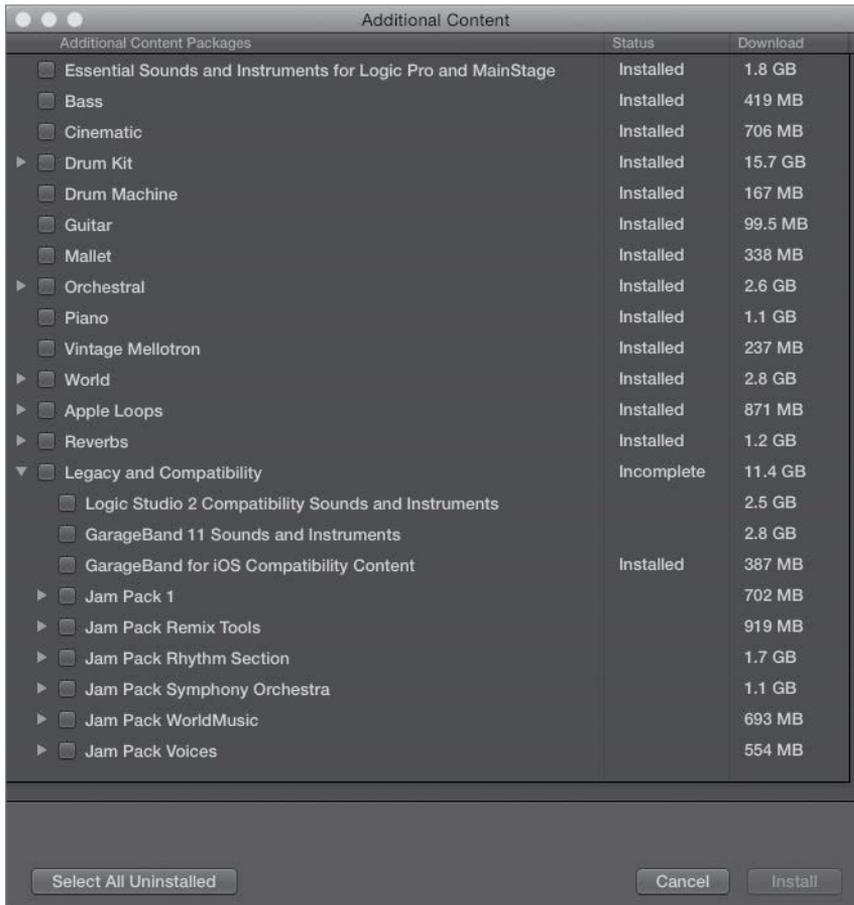

When you first open Logic Pro X, the app will automatically download and install about 2 GB of essential content. An alert then offers to download additional media content.

Click Download Additional Content to install all the Logic Pro X media content. In the Additional Content window, click the Select All Uninstalled button at the lower left, and double-click the “Legacy and Compatibility” checkbox to deselect it. Depending on the speed of your Internet connection, the following download may take several hours.

NOTE ► If you have already installed Logic Pro X but did not install the additional content, choose Logic Pro X > Download Additional Content, and click Select All Uninstalled (make sure the “Legacy and Compatibility” content is not selected). Finally, click Install.

After you’ve installed all additional media, your Additional Content window will resemble the following figure:

NOTE ▶ If you have previously installed the “Legacy and Compatibility” content, or if earlier versions of Logic are installed on your Mac, you may not always see the same results as those shown in this book, especially when viewing the library, the Loop Browser, or the plug-in settings menus.

Downloading and Using the Logic Lesson Files

The downloadable content for *Apple Pro Training Series: Logic Pro X Advanced Audio Production: Composing and Producing Professional Audio* includes the project and media

files you will use for each lesson. After you save the files to your hard disk, each lesson instructs you in their use.

To download these files, you must have your access code, which is available on a card placed in the back of the printed editions or on the “Where Are the Lesson Files?” page in electronic editions. When you have your code, do the following:

- 1** Using a browser, go to www.peachpit.com/redeem, and enter your access code.
- 2** Click Redeem Code, and sign in or create a Peachpit.com account.
- 3** In the Lesson & Update Files tab, locate the downloadable files on your Account page.
- 4** Click the lesson file link and download the file to your Mac desktop.

NOTE ► If you purchase or redeem a code for the electronic version of this book directly from Peachpit, the lesson file link will automatically appear on the Lesson & Update Files tab without the need to redeem an additional code.

- 5** After downloading the file to your Mac desktop, you’ll need to extract the .zip file to your Mac desktop to access a folder titled Advanced Logic X_Files.

The Advanced Logic X_Files folder contains two subfolders—Lessons and Media—that contain the project files for this course. Make sure you keep these two folders together in the Advanced Logic X_Files folder on your hard disk. When you do so, your Mac will maintain the original links between the lessons and media files. Each lesson explains which files to open for that lesson’s exercises.

Using Default Preferences and Selecting the Advanced Tools

All the instructions and descriptions in this book assume that you have enabled the Advanced Tools in Preferences. If you haven’t, follow these steps:

- 1** Choose Logic Pro X > Preferences > Advanced Tools.
- 2** Select Show Advanced Tools.
- 3** Click the Enable All button.

Using the U.S. Key Command Preset

This book assumes that you are using the default initialized key command preset for a U.S. keyboard. If you are not, you may find that some of the key commands in your Logic installation do not function as described in this book.

If at any point you find that the key commands don't respond as expected, make sure that the U.S. key command preset is enabled on your Mac by choosing Logic Pro X > Key Commands > Presets > U.S.

Screen Resolution

Depending on your display resolution, some of the project files may look different on your screen when compared to the figures in the book. When you open a project, if you can't see the whole window, move it until you can see the three window controls at the left of the title bar, and Option-click the Zoom button (the third button from the left) to fit the window to the screen.

When using lower display resolutions, you also may have to zoom or scroll more often than described in the book to perform some of the exercise steps. In some cases, you may have to temporarily resize or close an area of the Tracks window to complete an action in another area.

About the Apple Pro Training Series

Apple Pro Training Series: Logic Pro X Advanced Audio Production: Composing and Producing Professional Audio is part of the official training series for Apple Pro applications developed by experts in the field. The lessons are designed to let you learn at your own pace. You'll find that this book explores many advanced features and offers tips and techniques for using the latest version of Logic.

Although each lesson provides step-by-step instructions for creating a specific project, there's room for exploration and experimentation. Try to follow the book from start to finish, or at least complete the lessons in each part of the book in order. Each lesson concludes with a review section summarizing what you've covered.

For a complete list of Apple Pro Training Series books, see the ad at the back of this book, or visit www.peachpit.com/apts.

Apple Pro Training and Certification Program

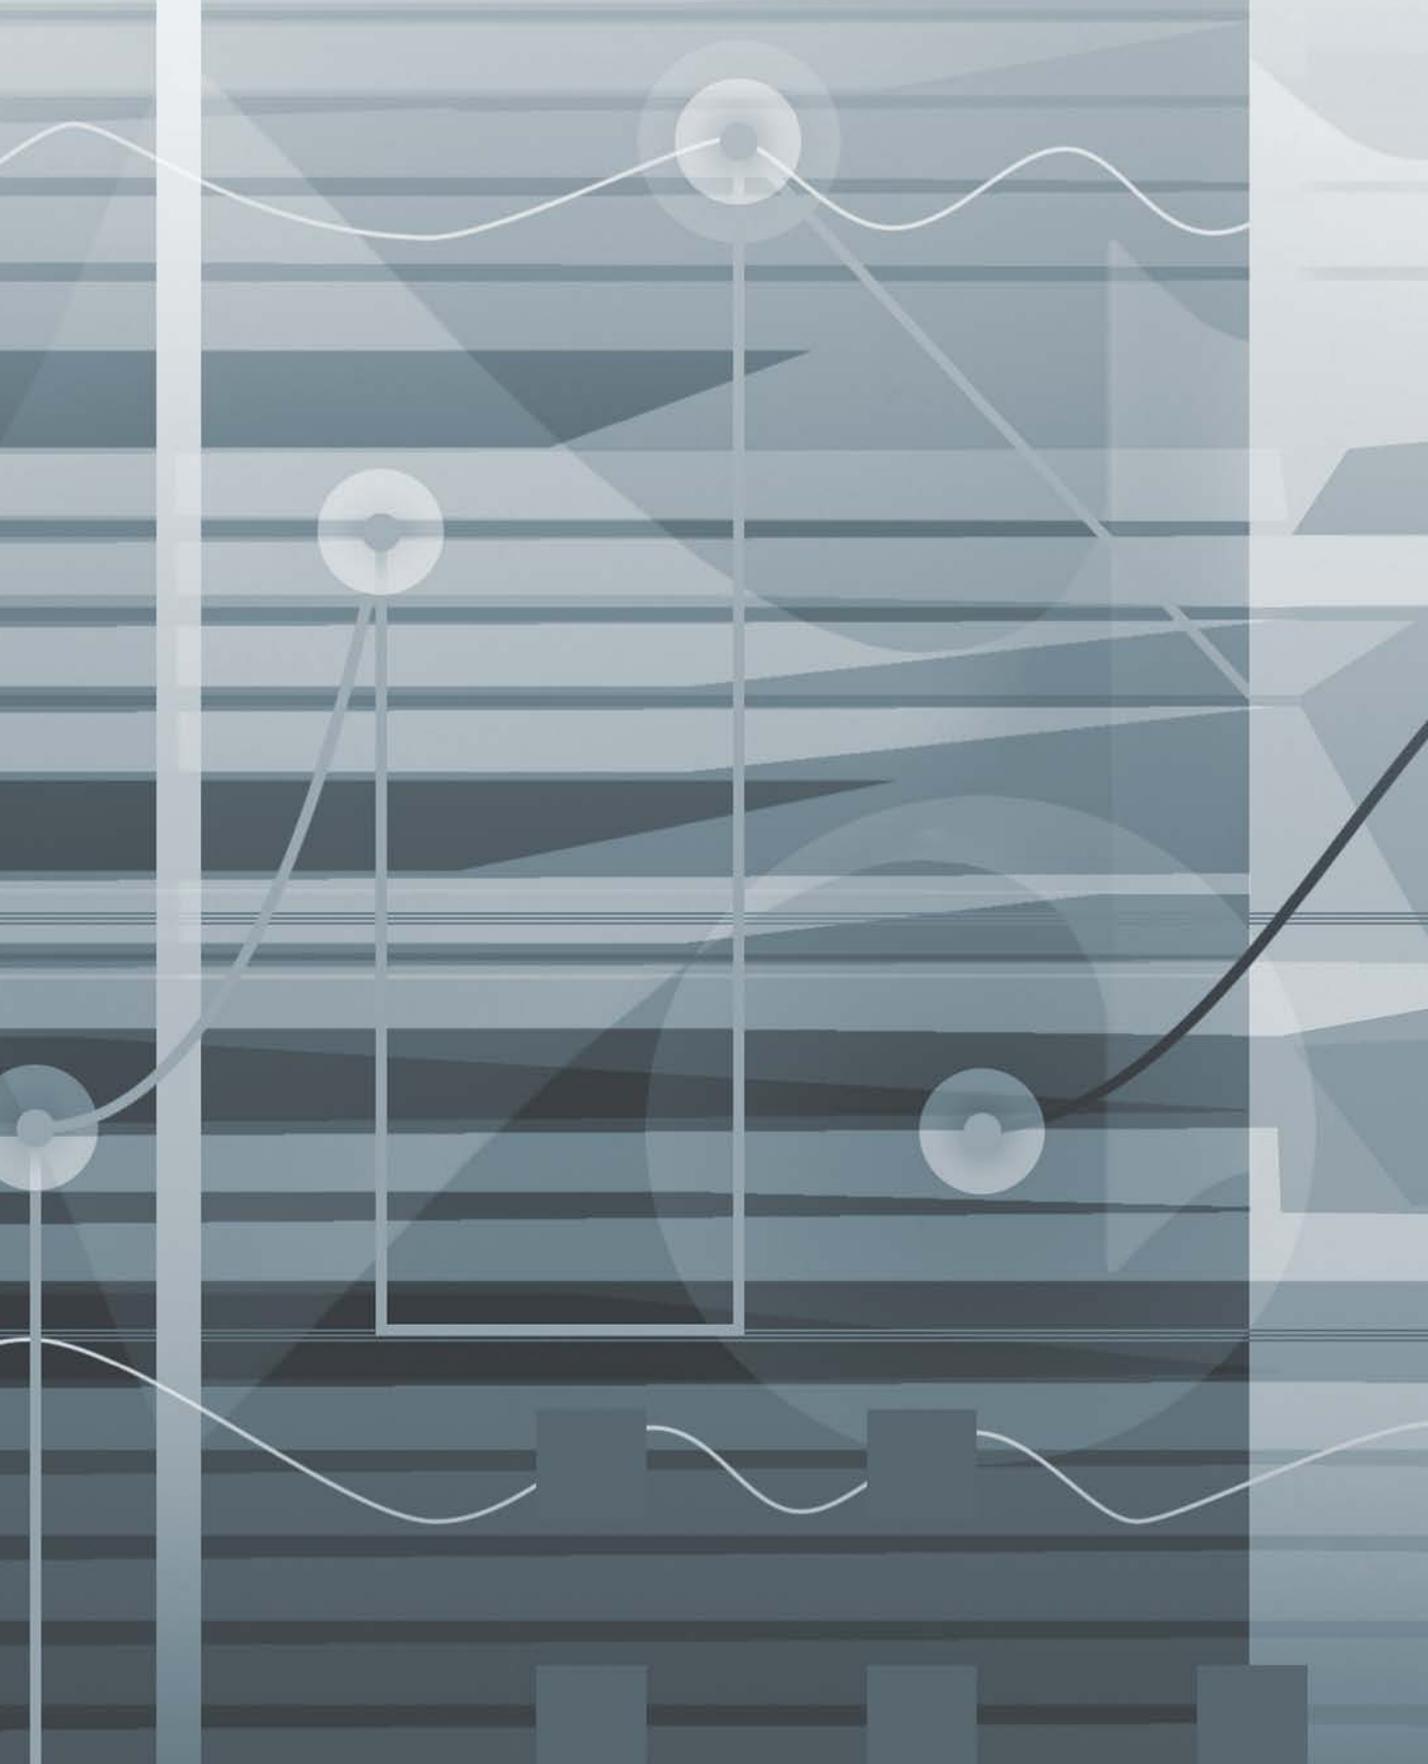

The Apple Pro Training and Certification Program is designed to keep you at the forefront of Apple digital media technology while giving you a competitive edge in today's ever-changing job market. Whether you're an editor, sound designer, special effects artist, or teacher, these training tools are meant to help you expand your skills.

For more information, go to training.apple.com.

Resources

Apple Pro Training Series: Logic Pro X Advanced Audio Production: Composing and Producing Professional Audio is not intended as a comprehensive reference manual, nor does it replace the documentation that comes with the application. For more information about Apple Logic Pro X, refer to these sources:

- ▶ Logic Pro Help, accessed through the Logic Pro X Help menu, contains a description of most features. Other documents available in the Help menu can also be valuable resources.
- ▶ The Apple websites www.apple.com/logic-pro/ and www.apple.com/support/logicpro/

4

Lesson Files

Advanced Logic X_Files > Lessons > 04_EXS24_Start.logicx

Media

Advanced Logic X_Files > Media > EXS24

Time

This lesson takes approximately 60 minutes to complete.

Goals

Build new sampler instruments from audio regions

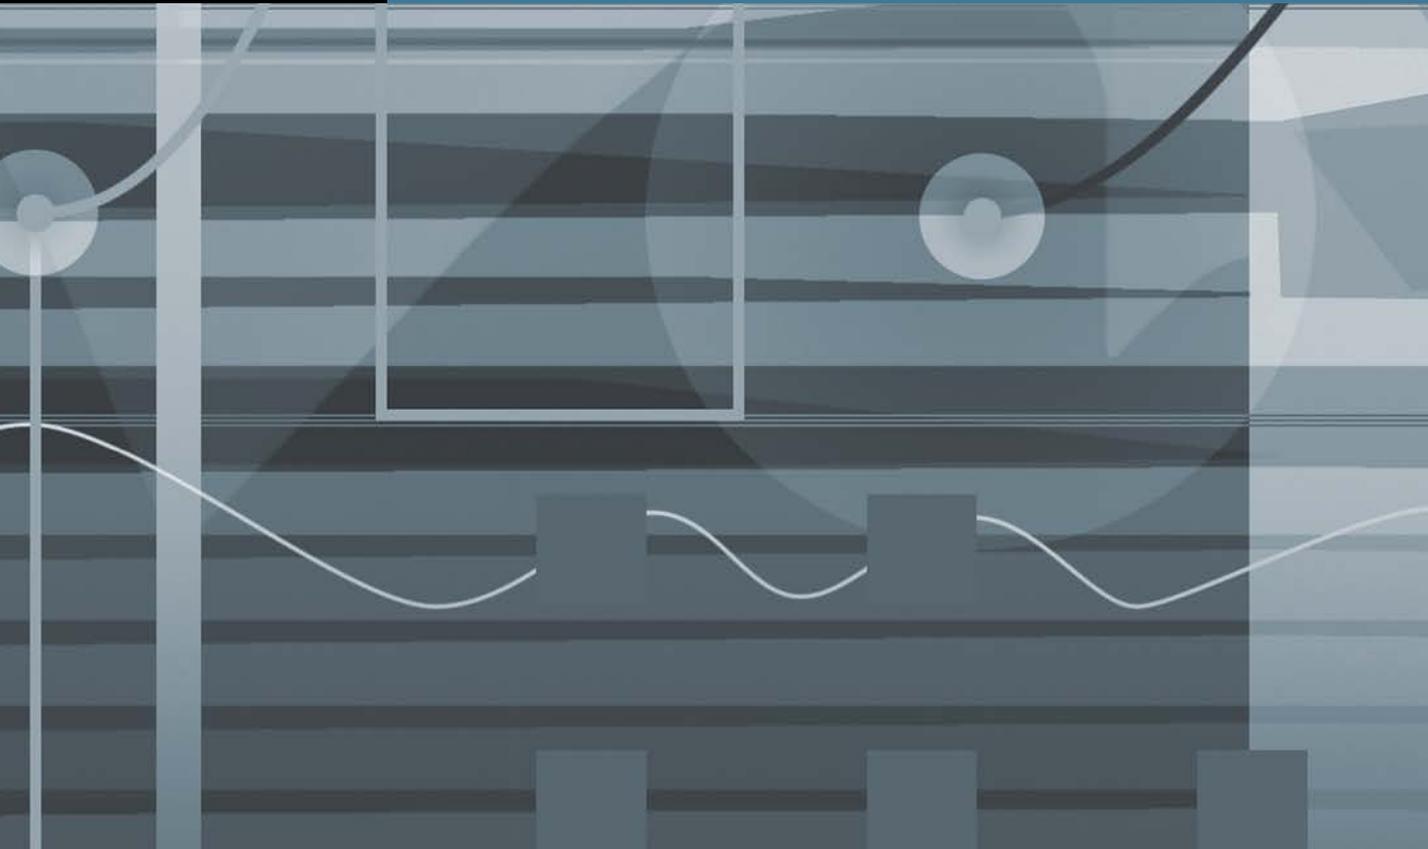

Assign pitch mapping and tuning to zones

Create loop points for sustaining sounds

Use groups to assign common parameters to multiple zones

Use filters and modulation to change the character of sampled material

Route output of specific groups for individual processing

Lesson 4

Sampling with the EXS24

A sampler is an extremely versatile tool. Essentially, it allows you to map digital audio files, or *samples*, across pitch ranges for triggering via MIDI. It does this by dynamically changing the playback speed of the samples in real time to match the pitch specified by the MIDI note value.

Individual samples are referenced and mapped in a *sampler instrument*. In this lesson, you will explore the abilities of the EXS24 by creating unique sampler instruments using specific audio regions from the Tracks area.

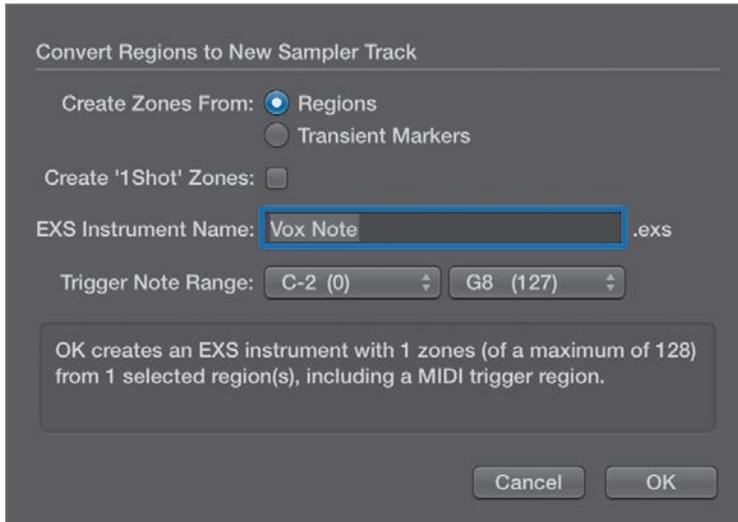

Creating Sampler Instruments

Traditionally, new sampler instruments are produced by first creating a blank sampler instrument, and then adding and mapping individual samples one by one, building the instrument from the ground up. However, Logic can also use a single command to automatically create a new EXS24 track loaded with a new sampler instrument wrapped around a selected audio region in the Tracks area. With this feature, extending the creative possibilities of audio files is especially easy, placing triggering and processing capabilities right under your fingertips.

- 1 Choose File > Open.
- 2 Open Music > Advanced Logic X_Files > Lessons > **04_EXS24_Start.logicx**.
- 3 Use the Mute tool to unmute the Vox Note region on Track 1.
- 4 Play the project, listening to the Vox Note audio region. You will use this recording of a singer holding a single pitch for your first sampler instrument.
- 5 Stop playback.
- 6 Go to the beginning of the project.
- 7 In the Tracks area, select the Vox Note region, if necessary.
- 8 From the Track menu, choose Convert Regions to New Sampler Track.

In the Convert Regions to New Sampler Track dialog, you can set how the selected audio region will be initially mapped in the new sampler instrument. Samples are mapped in zones, which contain settings that control how the sample is played back, including key ranges.

- 9 Select Create Zones From Regions, if necessary.

A single zone will reference the Vox Note audio region (as outlined at the bottom of the dialog).

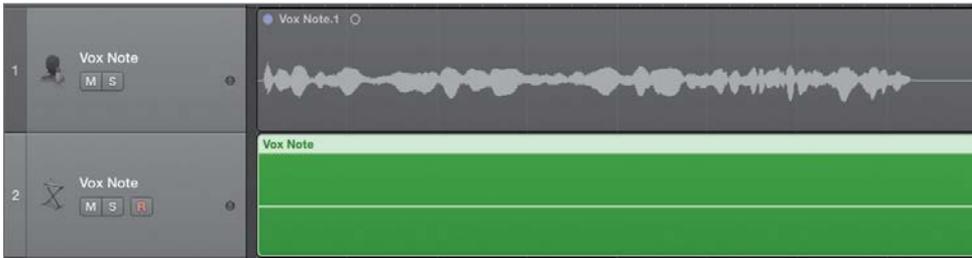

You can also set the pitch range of the created zone, as specified by the Trigger Note Range menus (low to high). Because only a single audio region was selected (you can also select multiple regions), it will utilize only the lowest trigger note to map the region.

- 10 From the first Trigger Note Range pop-up menu, choose C3 (60) to create a new zone at C3, right in the middle of the keyboard.

11 Click OK.

A new EXS24 track (named Vox Note) is created below the original track, along with a new MIDI region. This new region contains a held C3 note that triggers the newly mapped audio file for the same duration as the original audio region. Note that the original region is muted. The new MIDI region, in effect, replaces the original one in the arrangement.

**12** Play the project while listening to the new Vox Note MIDI region played through the EXS24. The playback sounds identical to the original.

This new zone will be automatically velocity mapped so that the harder you strike the key, the louder the sample will play.

13 Press C3 on your MIDI keyboard at varying velocities and listen to the results.

The Vox Note audio file plays as long as you hold down the key, while changing volume (amplitude) depending on how hard you hit the key.

Using the EXS24 Instrument Editor

Let's take a look inside the newly created sampler instrument with the goal of exploring the creative potential offered by the EXS24. You edit Sampler instruments in the EXS24 Instrument Editor, which is accessible from the EXS24 interface.

1 In the inspector, double-click the EXS24 in the channel strip to open the EXS24 interface.

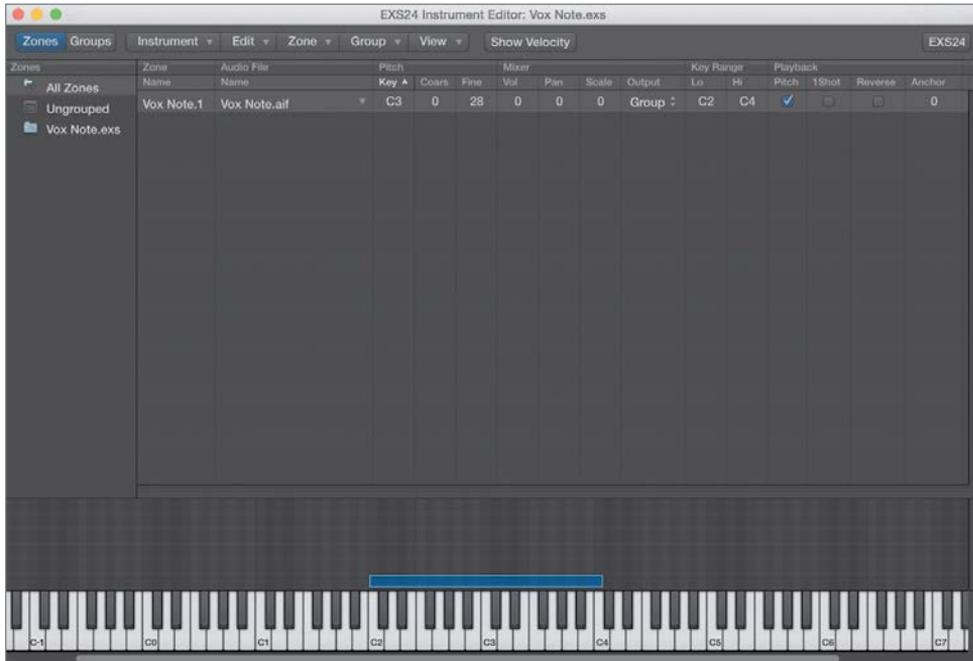

The EXS24 Parameter window opens with the newly created sampler instrument, Vox Note, displayed. You will be working with the parameters in this window later in the lesson; but for now, you will use it to quickly access the EXS24 Instrument Editor.

- 2 Click the Edit button.

The EXS24 Instrument Editor opens.

- To save some screen real estate, close the EXS24 Parameter window (but not the EXS24 Instrument Editor).

The EXS24 Instrument Editor has two views: Zones and Groups. You are currently looking at the Zones view (more on Groups later), as indicated by the selected button at the upper left.

The top portion of the EXS24 Instrument Editor is called the Parameters area, and it displays the settings of each sample referenced by the sampler instrument. The bottom portion of the window displays how each sample is mapped to various pitches, as represented by the keyboard at the bottom of the window. As you can see, a new zone named Vox Note.1 was created, mapped to C3 on the keyboard.

When you create a sampler instrument with the Convert Regions to New Sampler Track command, the zone created is without range—that is, mapped to only a single pitch.

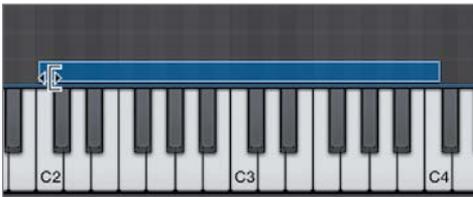

You can, of course, extend the zone's range to map the audio file to multiple pitches, either by changing settings in the Key Range columns of the Parameters area, or by directly dragging the zone in the lower area.

- 4 In the Key Range parameters, double-click the Hi field and enter *c4*. Press Return.

The zone extends in range to the right, from C3 to C4.

- 5 In the lower area of the EXS24 Instrument Editor, drag the zone's left border toward the left, extending the range to C2.

- 6 Play the C2 to C4 keys on your MIDI keyboard, listening to the result.

The pitch (and speed) of the sample shifts up and down, mapped in relation to your MIDI keyboard input.

NOTE ► You can also create new sampler instruments by choosing **New** from the EXS24 Instrument Editor's **Instrument** menu, or by clicking the **Edit** button on the EXS24 interface when an instrument isn't currently loaded. Doing so creates a blank sampler instrument in which you can manually add zones by choosing **New Zone** or **Load Multiple Samples** from the **Zones** menu. You can also create new zones by dragging audio files from the **Project Audio**, **Media**, or **All Files Browser**, or even the **Finder**.

If you have perfect pitch, you might have noticed that the sung note is a little flat compared to standard tuning (A440). It wouldn't be a problem if this were the only instrument used in the project, but if other instruments will be played at the same time, it would sound out of tune. Using the zone's **Pitch** parameters in the Instrument Editor, you can compensate for tuning discrepancies in **Coarse** or **Fine** degrees. (Coarse equals semitones, and Fine equals cents, or 1/100th of a semitone.)

The best way to tune a zone by hand is by inserting a Tuner plug-in on the EXS24 channel, monitoring the results as you adjust parameters.

- 7 Click the Audio FX slot of the new Vox Note (EXS24) channel, and choose Metering > Tuner > Stereo to open the Tuner.

- 8 While watching the Tuner readout, hold down the C3 key on your MIDI keyboard and drag the zone's Fine parameter upward to about 28 cents. (The Tuner's readout will bob around the 12 o'clock position.)

Pitch		
Key ▲	Coars	Fine
C3	0	28

The sample plays in tune relative to standard tuning.

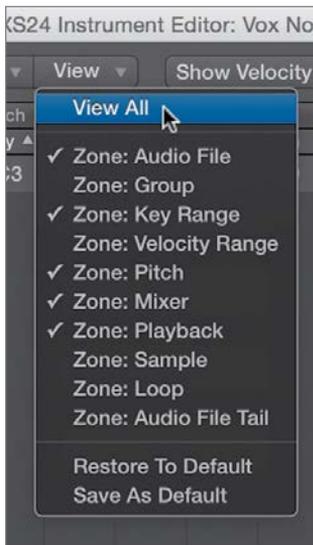

- 9 Close the Tuner window.

Creating Loop Points

Looping is a technique that stems from the days when samplers had tiny memory stores (by today's standards) in which to load samples. Many sounds start off with complex attacks but soon settle into a more or less steady waveform. By repeating this “settled” area, a sample can be sustained indefinitely without using up limited memory space. Even with modern software samplers that have access to gigabytes of memory (like the EXS24), looping is a useful technique to create sustaining sounds out of samples that are otherwise quite short, such as the audio file you are working with in this exercise.

By default, this editor displays only some of the Zone parameters, while hiding others, including the Loop parameters. You can select the parameters you want to display in the View menu.

- 1 From the local View menu, choose View All.

All Zone parameters are displayed, including the Loop parameters.

Loop					
On	Start	End	Tune	XFad	E.
<input type="checkbox"/>	0	0	0	0	<input type="checkbox"/>

NOTE ▶ Depending on the size of your EXS24 Instrument Editor window, you might need to scroll to the right to view the Loop parameters.

To enable looping, you first need to select the Loop On option.

- 2 In the Loop parameters, select Loop On.

Although you could enter start and end times (by sample number) in the parameters area, doing so would be arbitrary and counterintuitive. Selecting an area on the waveform itself using the Audio File Editor is much easier.

- 3 In the Audio File parameters for the zone, click the disclosure triangle to the right of the audio file name and choose “Open in Sample Editor.”

The Audio File Editor opens, displaying the referenced audio file, **Vox Note.aif**.

NOTE ▶ You most likely will need to expand the Audio File Editor window to complete the following exercise. If you have limited screen real estate, you can minimize the EXS24 Instrument Editor window, temporarily storing it in your Dock.

TIP ▶ Double-clicking an audio file in a zone also opens the audio file in the Audio File Editor.

You can set the Audio File Editor's timeline to display time using various units of measurement, depending on which is most useful for the task. For example, when setting loop points, you may find it most helpful to view the timeline in samples (1 sample = $1 \div$ sample rate per second.) That type of timeline setup corresponds to the numerical display in the EXS24 Instrument Editor.

NOTE ▶ Don't confuse samples (as a measurement of time) with audio samples, as mentioned earlier in the chapter. The latter is another way of saying "digital audio files," while the former refers to the tiny components that make up a digital waveform.

- 4 From the local View menu, choose Samples, if necessary.

The timeline is now displayed in samples.

The trick to setting loop points is to find a sustaining portion in the audio file you can repeat without interruption. To make smooth edits, you must make selections that do not interrupt the waveform above or below the zero axis (thereby creating an audible click). When you enable "Snap Edits to Zero Crossings" in the Audio File Editor, all new selections will be justified to the nearest point the waveform crosses the zero axis.

- 5 If not set already, choose Snap Edits to Zero Crossings from the local Edit menu.
- 6 Using the help tags, select an area from approximately 28800 to 91900 samples (refer to the following figure).

You can audition your selection by selecting the Prelisten and Cycle buttons at the top of the Audio File Editor.

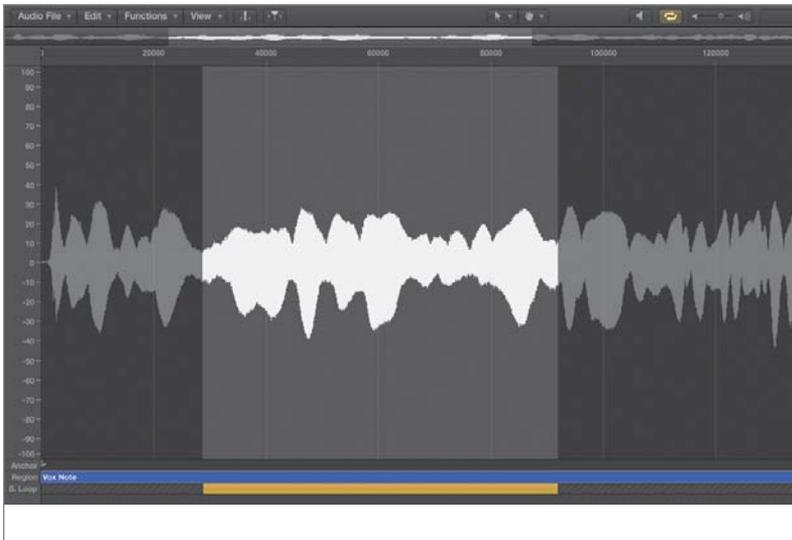

- 7 Click the Prelisten and Cycle buttons to listen to your selection looping.
- 8 Click the Prelisten button to stop playback.

TIP Your loop points may sound a bit rough at first, but with further massaging, you can create a smoother result. You do this by zooming in on the start and end loop points and fine-tuning the selection while auditioning the results.

Now that you've identified the area you want to be looped, you need to set the start and end loop points to the zone in the EXS24 Instrument Editor.

- 9 From the Audio File Editor's local Edit menu, choose Selection > Sample Loop.

The Sample Loop lane in the Audio File Editor displays the selected area in orange.

10 Close the Audio File Editor.

The results of your selection appear in the Loop parameters of the EXS24 Instrument Editor.

Loop		
On	Start	End
<input checked="" type="checkbox"/>	28791	91935

11 Hold down C3 on your MIDI keyboard, listening to the result.

The sample plays, now looping the selected area for as long as you hold down the key.

To aid you in smoothing out the repeating loop's start and end points, you can apply a short crossfade (much as you would smooth region transitions in the Tracks area).

12 In the Loop parameters, double-click the Xfade field and enter 30. Press Return.

Loop					
On	Start	End	Tune	XFad	E.
<input checked="" type="checkbox"/>	28791	91935	0	30	<input type="checkbox"/>

An option is also available to make the crossfade equal powered, which creates an exponential curve with a 3 db volume boost in the middle to compensate for the volume dip that normally occurs in a linear crossfade.

13 In the Loop parameters, select the E. Pwr option.

Loop					
On	Start	End	Tune	XFad	E.
<input checked="" type="checkbox"/>	28791	91935	0	30	<input checked="" type="checkbox"/>

14 Hold down a C3 on your MIDI keyboard, listening to the result.

The sample plays, smoothly looping the selected area for as long as you hold down the key.

Using the Parameter Window

After a sampler instrument is loaded, the triggered sounds are further refined and processed by the global playback parameters located on the interface of the EXS24 itself. These parameters, which are nearly identical to the sound processing functionality of a synthesizer, allow you to further shape your sampler instrument sounds.

- 1 In the EXS24 Instrument Editor window, click the EXS24 button.

The EXS24 Parameter window (interface) opens. It offers a convenient way to access the EXS24 playback parameters without having to go back to the channel strip.

- 2 Close the EXS24 Instrument Editor.

A Save dialog appears.

- 3 Click Save.

Now look at the EXS24's interface. Note that the EXS24 shares many interface characteristics with the ES2 synthesizer covered in Lesson 3. It has filter, output, modulation routing, and modulation source sections in similar places in the interface.

In this exercise, you will use the amplitude envelope to change the Vox Note sampler instrument's character to that of a swelling choir-like pad that decays slowly. In the EXS24, Envelope 2, which is hardwired to amplitude, controls the dynamics of how the sound is shaped over time for each key pressed.

- 4 In the controls for Envelope 2, drag the bottom half of the Attack slider upward to about 820 ms.

TIP You can split the Attack controls of both Envelopes 1 and 2 to create a range. This intensity range is modulated via note velocity, wherein high values trigger the sound more quickly (represented by the lower half of the control), and low values trigger the sound more slowly (represented by the upper half of the control).

- 5 In the controls for Envelope 2, drag the Release slider upward to about 820 ms.

- 6 Hold down a chord between C2 and C4 on your MIDI keyboard, listening to the result. You should hear a swelling, sustained choir sound, based on the original audio file, **Vox Note.aif**.
- 7 From the preset menu in the EXS24 window, choose Save As.
- 8 Name the preset *Vox Note* and click Save.
- 9 Close the EXS24 window

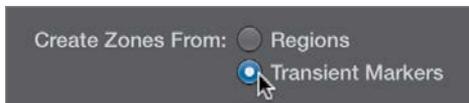

Creating Multiple Zones from Region Transients

In the previous exercises, you created a single zone sampler instrument from an audio file in the Tracks area. Using a similar technique, you can create a sampler instrument with multiple zones based on detected transients in the audio file. This is especially useful when dealing with rhythmic material such as drum and percussion loops that have clear transients.

In the following exercises, you will create a new sampler instrument from a basic drum loop and explore ways to extend and transform the sound using the EXS24 playback parameters and routing flexibility.

- 1 Use the Mute tool to mute the new Vox Note region (Track 2).
- 2 Select the Basic Drums track (Track 3).

- 3 Unmute the Basic Drums region on Track 3.
- 4 Play the project, and listen to the Basic Drums region to become familiar with the material.
- 5 From the Track menu, choose Convert Regions to New Sampler Track.
The Convert Regions to New Sampler Track dialog appears.
- 6 Select Create Zones From Transient Markers.

NOTE ► When you create zones from transient markers, Logic performs a quick transient detection similar to the one performed when you first activate Flex on a track. The number of detected transients appears in the info area at the bottom of the Convert Regions to New Sampler Track dialog.

- 7 Click OK.

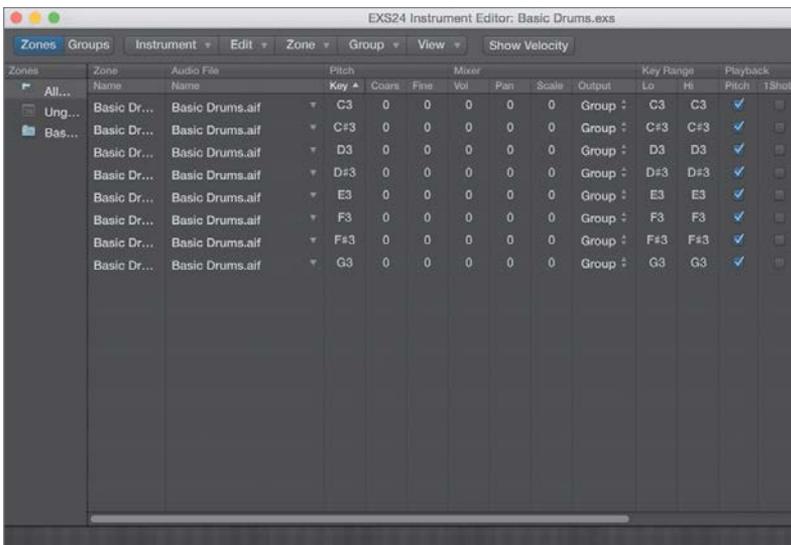

A new EXS24 track (also named Basic Drums) is created, along with a new MIDI region. This new region contains multiple note events that trigger each of the created zones in order, and for the same duration as the original audio region, thereby replacing the original audio region in the arrangement.

NOTE ► This operation is similar to using the Slicing Flex mode, wherein an audio region is chopped up according to its transients.

- 8 Play the project, listening to the new Basic Drums MIDI region played through the EXS24. The playback sounds identical to the previous version.
- 9 In the inspector, double-click the EXS24 in the channel strip to open the EXS24 interface.
- 10 Click the Edit button, located at the upper right.

The EXS24 Instrument Editor opens, displaying the multiple zones created from transients.

As you can see in the Parameters area, each transient from the original audio file is mapped chromatically to MIDI pitches C3 through G3.

- 11 Play the C3 through G3 keys on your MIDI keyboard, listening to the results.

When playing the associated MIDI pitches on the keyboard, you hear each individual slice. However, the slice plays only for as long as you hold down the key, and it can sound truncated if you release the key before the slice plays in its entirety. To allow the sample to play its complete length irrespective of the key release, you need to enable 1Shot in the Zone parameters.

- 12 With the EXS24 Instrument Editor window having key focus, press Command-A to select all of the zones.
- 13 On any of the selected zones, select the 1Shot checkbox to select it for all.

NOTE ▶ You can create 1 Shot zones automatically when converting audio files to sampler tracks by selecting Create ‘1 Shot’ Zones in the Convert Regions to New Sampler Track dialog.

- 14 Play the C3 through G3 keys on your MIDI keyboard, and listen to the results.

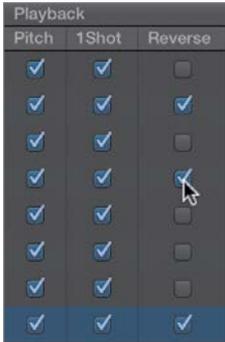

The slices play in their entirety.

Although this method provides an effective way to trigger the drums as a performance instrument, let’s explore additional playback parameters in the EXS24 Instrument Editor to further process the sound.

- 15 Click in the background of the EXS24 Instrument Editor to deselect all zones.
- 16 In the Parameters area, Command-click the zones mapped to C#3, D#3, and G3 to select them.

TIP ▶ To use your MIDI controller to select zones, choose Zone > Select Zone of Last Played Key.

- 17 Select the Reverse checkbox for one of the selected zones to enable it for all selected zones.

- 18 Play the C#3, D#3, and G3 keys on your MIDI keyboard, listening to the result. The samples play in reverse.
- 19 Close the EXS24 Instrument Editor window.
- 20 In the dialog that appears, click Save.

Using Filters and Modulation to Process the Sound

Just as you used the ES2 synthesizer to process the oscillators' signal, you can use the EXS24 filter and modulation options to process a sampler instrument you created. In fact, the EXS24's filter and modulation routers directly mirror the ones in the ES2, with the exception of offering only a single filter, instead of a pair.

The filter in the EXS24 is a multimode filter that includes high-pass, low-pass, and band-pass modes. To take advantage of its sound-shaping properties, you need to turn it on.

- 1 Click the filter on/off button located at the right side of the filter section.

NOTE ▶ The on/off switch for this filter enables you to quickly audition sounds with and without the filter’s influence. Also note that when the filter is active, Logic uses more processor power, so switch off the filter when you don’t need it.

Now that the filter is turned on, you can apply filter settings to shape the sound.

- 2 Do the following with the EXS24’s filter settings (as in the following figure):
 - ▶ Click the 6 db low-pass (LP) filter mode/slope button to gradually attenuate frequencies above the cutoff frequency.
 - ▶ Drag the Cutoff knob to about 68%.
 - ▶ Drag the Resonance knob to about 45% to accentuate the cutoff frequency by applying a gain boost.
 - ▶ Click the Fat button to retain the low frequencies that are naturally diminished by high-resonance settings.
 - ▶ Drag the Drive knob to about 20% to distort the filter and add harmonics.

Now that you’ve adjusted your filter settings, it’s time to hear the result.

- 3 Play the C3 through G3 keys on your MIDI keyboard, listening to the results of the filter settings.

You can further expand the filter’s sound-shaping properties by applying modulation to the cutoff frequency. The goal is to create a surging filter sweep that is timed to the tempo of the song. You can do so by using the EXS24’s modulation router, which is nearly identical to the ES2’s modulation router except that it calls a parameter that is changed dynamically the “destination” instead of the “target.”

- In the third (empty) slot in the modulation router, choose filter cutoff (Flt Cutoff) as the destination (Dest), and LFO1 as the source (Src).

- Drag the Intensity slider to about +7.7%.

- Select the top sawtooth setting for LFO1's waveform.

- Drag LFO1's Rate knob to the left to 1/8.

You now have a filter sweep for every eighth note, regardless of the project tempo.

NOTE ▶ The EXS24's LFO1 is polyphonic with its own envelope generator, just like the ES2.

Now you'll test your modulation routing. Because it's tempo dependent, let's listen to it playing in the Tracks area.

8 In the Transport bar, click the Cycle button.

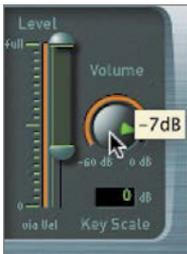

9 Play the project, listening to the result.

You should hear a sweeping, pulsing, swelling drumbeat that is significantly transformed from the original.

10 Stop playback.

While the loop was playing, you might have noticed that the EXS24 was distorting, and the channel volume pushed well into the red. This is because of the extra gain introduced by boosting the Drive and Resonance controls. You can recover a little headroom by lowering the EXS24 Volume control, located to the far right of the interface.

11 Drag the Volume knob downward to a value of -7 db.

Using Groups

In the EXS24 Instrument Editor, you can organize zones into groups to apply common parameters to multiple zones simultaneously. Groups contain many of the same parameters you use in zones, but they also offer some unique parameters. For example, you can offset both the filter settings and the envelopes, which allows you to create different cutoff and resonance values for different zones.

In the sampler instrument you created, the low-pass filter cut out the high frequencies of all samples. By using groups, you can, in effect, apply a different cutoff frequency for just the snare hits.

1 In the EXS24 interface, click the Edit button to open the EXS24 Instrument Editor.

- From the local menu, choose Group > New Group.

A new group, named Group #3, appears in the Zones column.

NOTE ► In addition to the newly created group, the Zones column displays All Zones, Ungrouped, and Basic Drums groups. The All Zones group contains all zones, regardless of their assignments. The Ungrouped group contains only zones that have no assignment whatsoever. The Basic Drums group, created by default when you imported the samples into the EXS24 Instrument Editor, contains all the slices created using the Convert Regions to New Sampler Track setting.

- In the Zones column, double-click the new group name (Group #3), and enter *Filter*. Press Return.

To display the newly created group's parameters, you need to switch to Groups view.

- Click the Groups view button.

The group parameters appear.

NOTE ▶ By default, the editor displays only some of the group parameters, while hiding others. As you did with zones in an earlier exercise, while in Groups view you can select the parameters that will appear in the View menu.

- 5 In the Filter Offsets parameters, double-click the Cutoff field and enter -5 to lower the filter cutoff frequency for any zone assigned to this group. Press Return.

Now that you created and modified the group, you'll assign the zones to it using the Zones view.

- 6 Click the Zones view button.

You might be asking yourself, “Where did the zones go?” Not to worry; you are currently viewing the Filter group, which does not yet have any zones assigned to it.

- 7 Click the All Zones group to display all zones.

You can easily assign zones to groups by dragging them onto the groups in the Zones column.

- 8 Command-click the zones mapped to D3 and F#3 to select them.
- 9 Drag the selected zones to the Filter group.

- 10 In the Zones column, select the Filter Group.

The two zones you added appear.

- 11 Play the project, listening to the result.

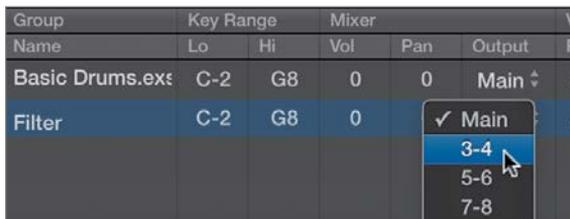

The snare samples mapped to D3 and F#3 have a slightly different filter cutoff frequency, thereby changing their sounds.

Routing Individual Sounds for Processing

As if the options offered by the EXS24's modulation and filter sections weren't enough, Logic allows you to further process the EXS24 sound by placing plug-ins into the signal chain. When you do so, the entire EXS24 signal is processed. Although processing the entire signal normally isn't a problem, in some instances you may want to apply separate processing to individual zones in a sampler instrument. To do so, you need to isolate the zone or group on its own mixer channel for individual processing.

Fortunately, the EXS24 allows you to route individual sounds through separate virtual "outputs" to accomplish just that. These routings are selected by the Output menu in the Mixer parameters in either the Zone or Group parameters.

- 1 Click the Groups view button.
- 2 Click the Output field for the Filter group (currently set to Main), and choose 3-4.

NOTE ► The selections with dashes separating numbers represent stereo routings, and the selections with single numbers (without dashes) represent mono routings.

- 3 From the local Instrument menu, choose Save.

To use this special function, you need to instantiate the EXS24 as a multi-output instrument. So far you've been working with the EXS24 as a stereo instrument and have done quite a bit of work modifying the zones and groups. Luckily, Logic allows you to keep all your current settings when changing from stereo to multi-output instantiations.

NOTE ► Logic transfers all settings and content contained in a software instrument when you switch modes (mono, stereo, multi-output, and 5.1).

- 4 Close the EXS24 Instrument Editor window.
- 5 Click the Mixer button to open the Mixer.

- 6 On the Basic Drums channel strip (Track 4), click and hold down the mouse button over the Instrument slot to open the Instrument Plug-in menu. Choose EXS24 (Sampler) > Multi Output.

The EXS24 interface opens after reloading the associated samples and current settings.

- 7 If necessary, move the EXS24 window so that you can see the EXS24 Basic Drums channel strip (Track 4).
- 8 Just under the Solo button, click the small + (plus sign) button on the EXS24 Basic Drums channel strip (Track 4).

A new Aux 1 channel strip is created immediately to the right of the EXS24 Basic Drums channel strip (Track 4). It will be the receiving channel for your Filter group. By default, Logic creates an aux channel with the default stereo input of 3-4 for the associated multi-output instrument (in this case, the EXS24).

- 9 Play the project, stopping playback after you've had a chance to hear the output of the Aux 1 channel.

The zones assigned to the Filter group play through the Aux 1 channel, while the remaining zones play through the EXS24 Basic Drums channel (Track 4).

TIP This technique works well for drum sampler instruments that need separate compression, EQ, and ambience treatments for individual drums (kick, snare, and so on).

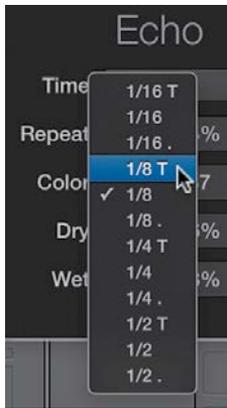

Now that the snare slices are isolated on their own mixer channel, you can insert plug-ins or apply send effects for further processing without affecting the other slices in the sampler instrument. In the following steps, you will send the snare slices through a simple Echo plug-in to create rhythmic echoes.

- 10 Click the Aux 1 channel's top insert slot, and choose Delay > Echo > Stereo.

The Echo plug-in is instantiated, and its interface window opens.

- 11** Click the Time menu, and choose 1/8 T to set the repeat time to eighth-note triplets.

- 12** Drag the Wet slider down to 23% to lower the repeats' volume level so they do not overpower the original signal.
- 13** Play the project, listening to the effect of all the EXS24 programming you've done in the previous exercises.

The result is a surging, shuffling, processed drum loop, quite abstracted from the original audio file.

- 14** From the Echo plug-in's preset menu, choose Save As.
- 15** Name the preset *Snare Repeats* and then click Save.

To gain perspective on just how much you changed the original loop, let's finish by listening to it.

- 16** Close both the Echo and EXS24 windows.
- 17** Close the Mixer.
- 18** Using the Mute tool, select the Basic Drums.1 region on Track 3, thereby unmuting the original region.
- 19** In the Transport bar, click the Solo button to enable it.
- 20** Play the project.

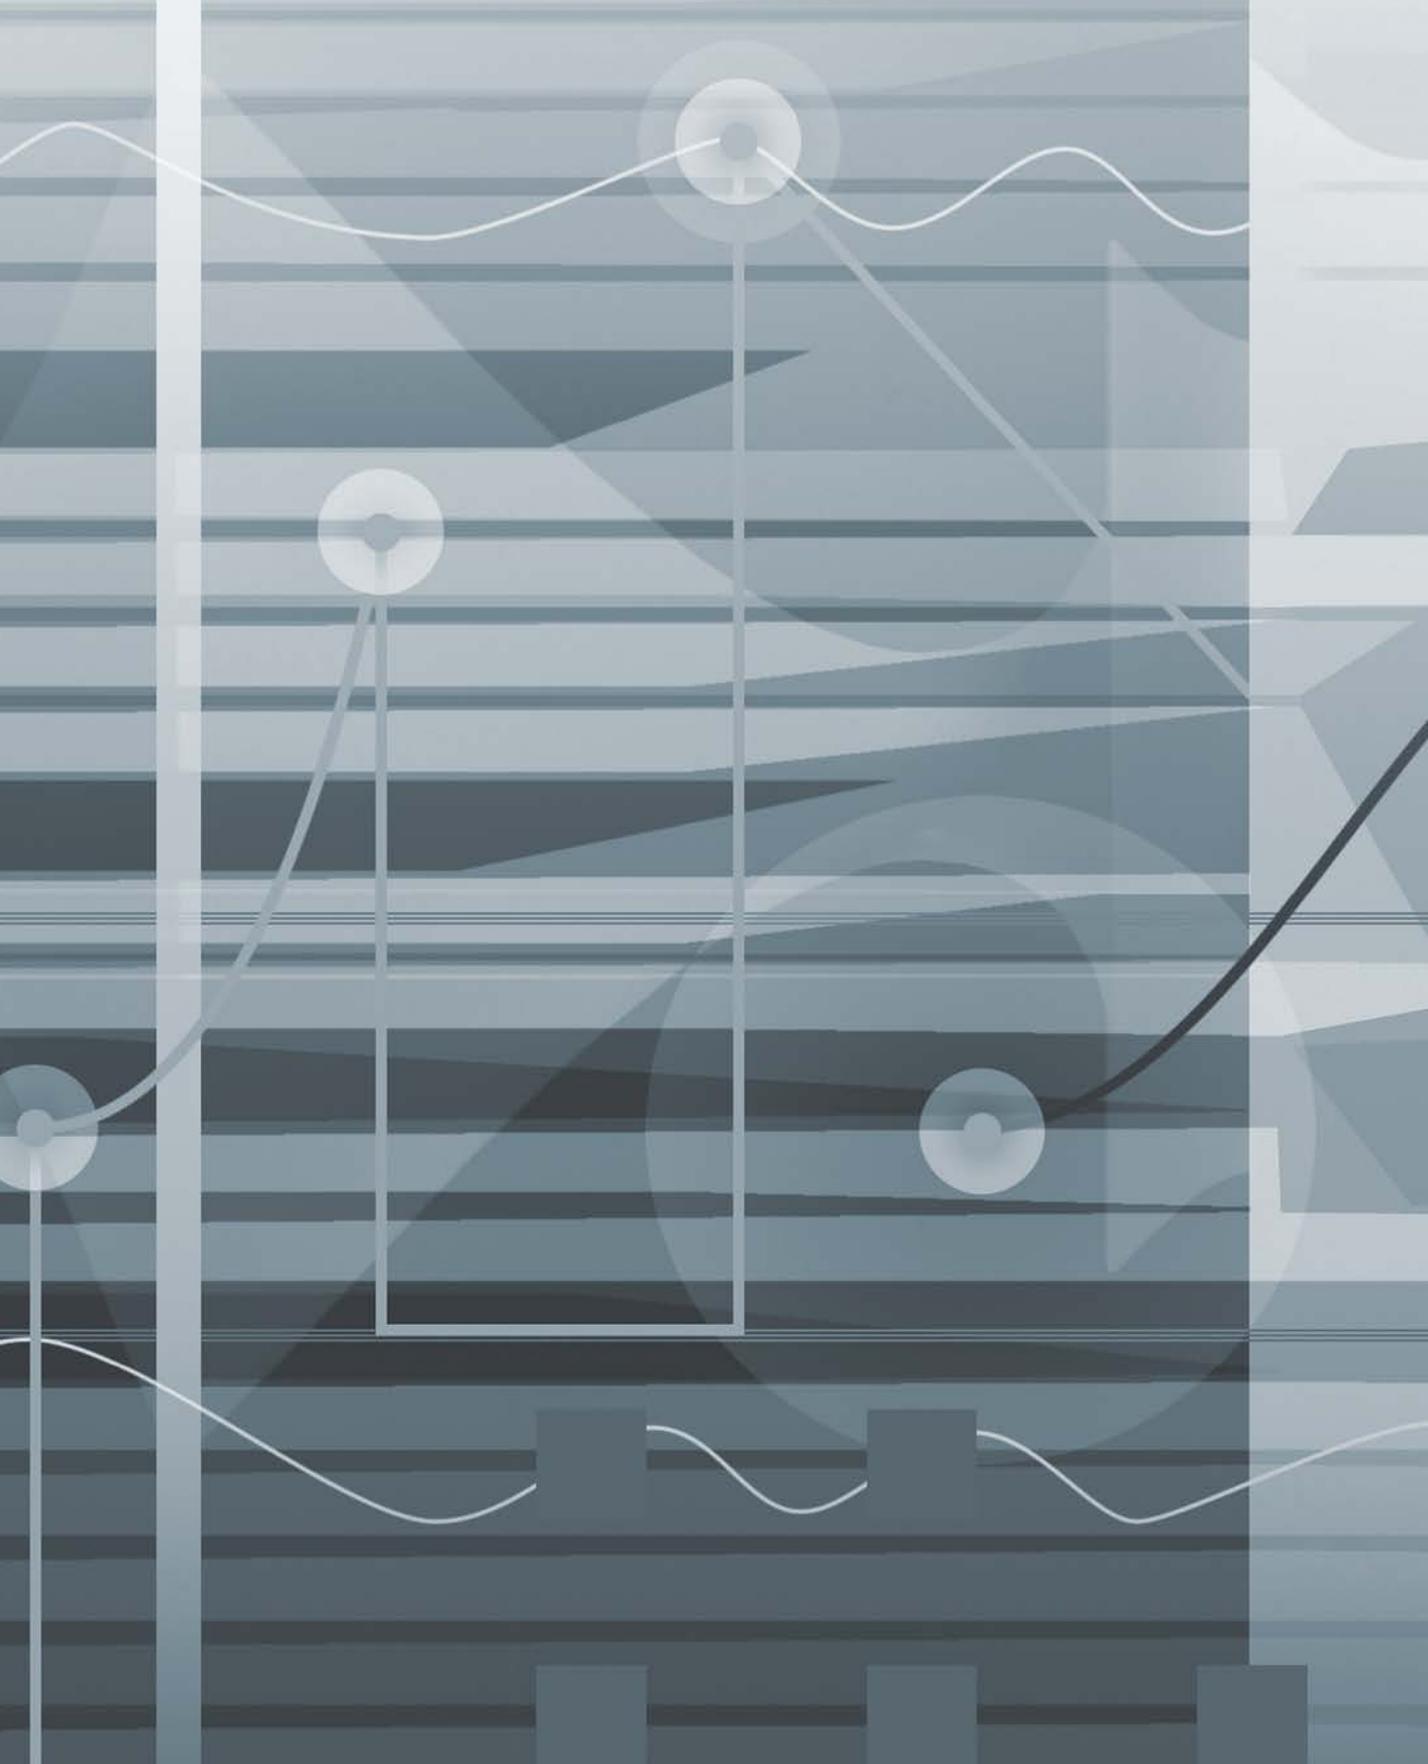

- 21 While the project is playing, select the original Basic Drums audio track (Track 3) and EXS24 Basic Drums software instrument track (Track 4) alternatively to solo them.
- 22 Stop playback.
- 23 In the Transport bar, click the Solo button to disable it.

Lesson Review

1. Where are individual samples referenced and mapped?
2. Where do you find the settings that determine how a sample is played, including key ranges?
3. Which tuning parameter in the EXS24 Instrument Editor is used to tune by cents: Coarse or Fine?
4. Are loop points set in zones or groups?
5. Which EXS24 Instrument Editor parameter is used to smooth out transitions between the end points and start points of a loop?
6. How are groups used in the EXS24 Instrument Editor?
7. Are filter and envelope offsets set in zones or groups?
8. What do multi-output instruments do?

Answers

1. Samples are mapped in sampler instruments.
2. Zones contain the settings for sample playback and key range.
3. The Fine parameter is used to tune by cents.
4. Loop points are set in zones because they refer to specific samples.
5. The Xfade parameter allows you to assign a crossfade between the end and start points of a loop, making it smoother.
6. Groups are used to assign common parameters to multiple zones.
7. Filter and envelope offsets are set in groups.
8. Multi-output instruments (such as Ultrabeat and EXS24) can route individual sounds to separate channel strips for isolation or further processing.

Gtr Ostinato track, quantizing, 52–53

Guides, View menu, 535

Guitar notation

- creating chord charts, 528–531
- creating chord grids, 532–536
- creating polyphonic staff style, 517–524
- overview of, 515–517
- preparing MIDI regions, 536–538
- text styles, 525–527
- text use in, 524–525
- transcribing performances, 536
- viewing MIDI data, 538–541

Guitars

- creating comps, 250–255
- creating new parts from existing, 245–246
- fixing clicks, 242–245
- importing channel strips and data, 320–322
- packing parts into take folder, 246–250
- printing parts, 553–556
- processing sound, 159
- removing material from arrangement, 223–227
- smoothing transitions with crossfades, 236–239
- switching contents of plug-in window, 334–336

H

Half-time, manipulating timing of audio regions, 35–36

Hardware, incorporating external effects processor, 369–370

Harmony/harmonics

- EXS24 filter settings, 137
- hi-hat effect and, 173
- ring modulation and, 90
- sidebands and, 89
- using Flex Time and Pitch to double a part, 60–61

Headphones, creating headphone mix

- using pre-fader sends, 361–364

High-pass filters

- on LFE channel, 440
- multimode filters, 96–97, 136
- in Ultrabeat, 172, 179–180

Hi-hats

- creating hi-hat sounds, 173–175
- panning stereo tracks, 331
- separating MIDI events (kicks from hi-hats), 313–314
- trimming HiHat region of drum track, 259–260

Humanize function

- customizing, 312
- transform functions, 303–305, 307, 311

I**Importing**

- Broadcast WAVE files, 575–577
- channel strips and data, 320–322

- comparing ES2 and EXS24, 130
- creating headphone mix using pre-fader sends, 361–364
- customizing for improved workflow, 8–10
- ES2 user interface, 82–83
- EXS24 user interface, 120–121
- labeling inputs/outputs, 364–367
- output channels in, 327
- Sculpture user interface, 150–151
- Ultrabeat, 166

I/O (input/output). *See* Inputs; Outputs

I/O plug-in

- incorporating external effects processor, 367–370
- as insert effect, 370

J

Jitter generators, in modulation section of Sculpture, 159

Join > Regions option, Edit menu, 314, 541

Junction tool, changing transitions between markers, 211

K**Key commands**

- assigning for MIDI controllers, 399–401
- assigning generally, 17–20
- backing up, 29
- functions accessible via, 20–21
- list of common, 24–25
- for viewing assignments, 16–17

Key focus, assigning, 14

Key Range parameters, for sampler instrument, 123

Key signatures

- displaying global tracks, 69
- entering notes graphically and, 505

Keyboards

- Chord Memorizer window and, 471
- MIDI. *See* MIDI keyboards
- onscreen musical keyboard, 168
- Step Input keyboard, 513–515

Kicks

- adjusting project feel, 288–289
- creating kick drum sounds, 168–171
- modifying region velocity, 285–287
- production note example, 330
- quantizing drums, 264–265
- replacing drums, 269–276
- separating MIDI events (kicks from hi-hats), 313–314
- side chain effects, 350–355

Knobs

- assigning channel controls, 401–405
- mapping controls to multiple parameters, 405–407

L

Latch mode, for automating recordings, 395

Layer menu

- Click & Ports layer, 460
- Create Layer, 462
- Rename Layer, 463

Layouts

- Show Score sets, 549

 - adjusting EXS24 volume, 139
 - assigning buttons for switching between modes, 410–412
 - assigning fader controls, 401–405
 - consistency of, 286
 - creating crescendo effect, 389–390
 - creating Volume mode, 410
 - mapping controls to multiple parameters, 405–407
 - positioning send controls, 356
 - Vox Note audio region, 118
 - Vox Telephone region, 221
- W**
- Waveforms
 - analog, 168
 - digital waveforms as modulation source, 89
 - drawing out clicks in audio file, 244–245
 - generating raw waveforms, 351–354
 - oscillator pitch and, 101–102
 - oscillators, 83–88
 - smoothing transitions with crossfades, 236
 - testing kick drum sounds in Ultrabeat, 169
 - Waveshaper, processing sound, 158
 - Workflow, speeding up
 - accessing Tool menu, 23–24
 - adding tool assignments to screensets, 22–23
 - assigning Key commands, 17–20
 - backing up/transporting setup, 29
 - creating screensets, 10–12
 - creating/configuring tracks, 5–7
 - customizing interface, 8–10
 - importing screensets, 30
 - list of common key commands, 24–25
 - locking screensets, 15
 - maximizing screen space, 13–14
 - opening/creating projects automatically, 27–29
 - overview of, 3
 - review, 31
 - saving project templates, 27
 - Tool click zones for region editing, 25–26
 - Tool menu control with two-button mouse, 26–27
 - utilizing functions accessible via key commands, 20–21
 - viewing key command assignments, 16–17
- Workspace
- maximizing screen space, 13–14
 - minimizing EXS24 Instrument Editor, 126
- X**
- Xfade parameter, 129. *See also* Crossfades
 - XML (Extensible Markup Language), 574–575
 - X-Y (Planar) pad, 111–113
- Z**
- Zones
 - creating multiple zones from region transients, 132–136
 - EXS24 Instrument Editor view options, 122–123
 - mapping controls to multiple parameters, 407–410
 - organizing into groups, 139–142
 - routing individual sounds for processing, 143
 - Zooming/Zoom tool
 - editing marker positions, 211
 - navigating drums track, 49–50
 - navigating to playhead position or to region, 205
 - in Score Editor, 555
 - selecting tracks, 229
 - viewing region content, 54
 - Zoom to Fit Locators, 387
