**Acknowledgments** First and foremost, my biggest thanks go to Bill Burgess, for believing in me from the very beginning, and without whom this book wouldn't exist.

I would like to express my thanks to my wife Nathalie and to my sons Liam and Dylan for their support and encouragement; to my editors Lisa McClain and Bob Lindstrom for being by my side and enabling me to write the best book I could write; and to Bob Hunt, Manfred Knauff, Thorsten Adam, John Moores, Shane Ross, and Robert Brock for their invaluable guidance.

My deepest gratitude to the artists and producers who agreed to provide their Logic sessions for this book: Distant Cousins for their songs "Raise It Up" and "BIG," Televisor for their song "Alliance," and Matt McJunkins for helping me write and produce the song "Little Lady."

# Getting Started

Welcome to the official Apple Pro Training Series course for Logic Pro X 10.1. This book is a comprehensive introduction to professional music production with Logic Pro X. It uses real-world music and hands-on exercises to teach you how to record, edit, arrange, mix, produce, and polish audio and MIDI files in a professional workflow. So let's get started!

## **The Methodology**

This book takes a hands-on approach to learning the software, so you'll work through the project files and media you download from [www.peachpit.com](http://www.peachpit.com). It's divided into lessons that introduce the interface elements and ways of working with them, building progressively until you can comfortably grasp the entire application and its standard workflows.

Each lesson in this book is designed to support the concepts learned in the preceding lesson, and first-time readers should go through the book from start to finish. However, each lesson is self-contained, so when you need to review a topic, you can quickly jump to any lesson.

The book is designed to guide you through the music production process as it teaches Logic. The lessons are organized into four sections.

### **Lessons 1–3: Exploring the Interface and Working with Real Instruments**

In this section, you'll explore the fundamentals of Logic Pro X and learn to record and edit audio.

Lesson 1 starts you out with an overview of the entire process. You'll become familiar with the interface and the various ways to navigate a project; use Apple Loops to build a song from scratch; and then arrange, mix, and export the song to an MP3 file.

Lessons 2 and 3 dive deeper into typical situations you may encounter when recording from microphones or other audio sources. You'll edit recordings to select the best portions of multiple takes, remove clicks, align recordings, and even reverse a recording to create a special effect.

### **Lessons 4–6: Working with Virtual Instruments**

Lesson 4 describes how to produce virtual acoustic and electronic drummer performances using Drummer, Drum Kit Designer, and Drum Machine Designer. You will choose the right drummer for the project, swap a drum kit with the kit of another drummer, edit the patterns, change which kit elements the drummer plays, shape an interpretation, and precisely control where fills are placed.

Lessons 5 and 6 immerse you in using software instruments. After choosing virtual instruments and recording MIDI performances, you'll map Smart Controls to various plug-ins and assign them to your MIDI controller. Using the free Logic Remote app, you'll control Logic from your iPad, and then create virtual performances in MIDI editors using your mouse or your MIDI keyboard. The Logic Remote icon will appear in the margin when related content appears.

### **Lessons 7–8: Building a Song**

In Lessons 7 and 8, you'll apply Flex editing to precisely adjust the timing and pitch of notes in an audio recording. Varispeed will allow you to work with your project at different tempos. You'll add tempo changes and tempo curves to a project, match the tempos of multiple tracks, and make a track follow the groove of another track. Also covered are tuning a vocal recording, editing a project's regions in the workspace to complete an arrangement, and adding and removing sections of a project.

### **Lessons 9–10: Mixing and Automating a Song**

Lessons 9 and 10 instruct you in mixing audio and MIDI files into a final project: adding audio effects, adjusting levels, panning, EQing, adding delay and reverb, automating the

mix by creating automation curves on your screen, and altering parameter values in real time with the mouse or a MIDI controller.

Appendix A describes how to use external MIDI devices, and Appendix B lists a wealth of useful keyboard shortcuts.

## System Requirements

Before using *Apple Pro Training Series: Logic Pro X 10.1*, you should have a working knowledge of your Mac and the Mac OS X operating system. Make sure that you know how to use the mouse and standard menus and commands, and also how to open, save, and close files. If you need to review these techniques, see the printed or online documentation included with your system.

Logic Pro X and the lessons in this book require the following system resources:

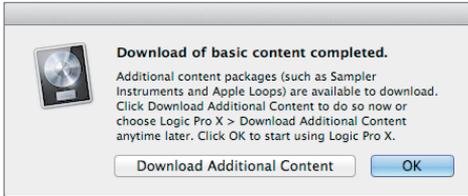

- ▶ Mac computer with an Intel processor, including:
  - 4 GB of RAM
  - Display with 1280 x 768 or higher resolution
  - Mac OS X v10.9.5 or later
  - Minimum 41 GB of disk space to install Logic Pro X and its media content
  - High-speed Internet connection for installation
- ▶ A USB-connected MIDI keyboard (or compatible MIDI keyboard and interface) to play software instruments
- ▶ A low-latency multi-I/O audio interface (highly recommended for audio recording)
- ▶ An iPad (optional) for controlling Logic using the Logic Remote iPad app

## Preparing Your Logic Workstation

The exercises in this book require that you install Logic Pro X along with its default media content. If you have not yet installed Logic, you may purchase it from the App Store. When your purchase is completed, Logic Pro X will automatically be installed on your hard drive.

All the instructions and descriptions in this book assume that you installed Logic Pro X on a Mac without any legacy Logic media, and that you downloaded all the additional media except for the Legacy and Compatibility content.

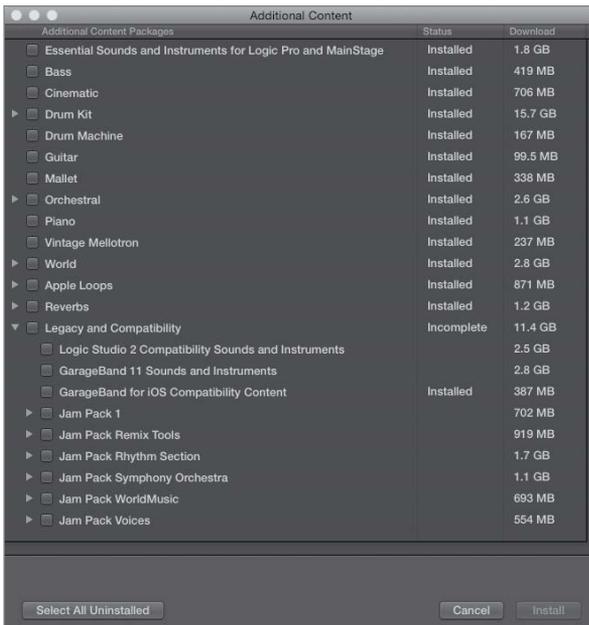

When you first open Logic Pro X, the app will automatically download and install about 2 GB of essential content. An alert then offers to download additional media content.

Click Download Additional Content to make sure that you install all the Logic Pro X media content. After you click Download Additional Content, the Additional Content window opens. Click the Select All Uninstalled button at the bottom left, and click the “Legacy and Compatibility” checkbox twice to deselect it. Depending on the speed of your Internet connection, the download process may take several hours.

**NOTE** ▶ If you have already installed Logic Pro X but did not install the additional content, choose Logic Pro X > Download Additional Content, click Select All Uninstalled (make sure the Legacy and Compatibility content is not selected), and click Install.

After you’ve installed all additional media content, your Additional Content window should look like the following figure:

**NOTE ►** If you have previously installed the Legacy and Compatibility content, or if you have earlier versions of Logic installed on your Mac, you may not always see the same results as those shown in the book, especially when viewing the Library, the Loop Browser, or the plug-in settings menus.

### **Downloading and Using the Logic Lesson Files**

The downloadable content for *Apple Pro Training Series: Logic Pro X 10.1* includes the project files you will use for each lesson, as well as media files that contain the audio and MIDI content you will need for each exercise. After you save the files to your hard disk, each lesson will instruct you in their use.

To download these files, you must have your guide's access code—provided on a card in the back of the printed editions of this book or on the “Where Are the Lesson Files?” page in electronic editions of this book. When you have the code:

- 1** Go to [www.peachpit.com/redeem](http://www.peachpit.com/redeem), and enter your access code.
- 2** Click Redeem Code, and sign in or create a Peachpit.com account.
- 3** Locate the downloadable files on your Account page under the Lesson & Update Files tab.
- 4** Click the lesson file link and download the file to your Mac desktop.

**NOTE ►** If you purchase or redeem a code for the electronic version of this guide directly from Peachpit, the lesson file link will automatically appear on the Lesson & Update Files tab without the need to redeem an additional code.

- 5** After downloading the file to your Mac desktop, you'll need to unzip the file to access a folder titled Logic Pro X Files, which you will save to your Mac desktop.

Logic Pro X Files contains two subfolders, Lessons and Media, that contain the working files for this course. Make sure you keep these two folders together in the Logic Pro X Files folder on your hard disk. If you do so, your Mac should be able to maintain the original links between the lessons and media files. Each lesson explains which files to open for that lesson's exercises.

### **Using Default Preferences and Selecting the Advanced Tools**

All the instructions and descriptions in this book assume that you are using the default preferences (unless instructed to change them). At the beginning of Lesson 1, you will be instructed how to show advanced tools and select all additional options.

If you have changed some of your Logic Pro X preferences, you may not realize the same results as described in the exercises. To make sure that you can follow along with this book, it's best to revert to the initial set of Logic preferences before you start the lessons. Keep in mind, however, that when you initialize preferences, you lose your custom settings, and later you may want to reset your favorite preferences manually.

- 1** Choose Logic Pro X > Preferences > Advanced Tools.
- 2** Under Additional Options, select Audio, Surround, MIDI, Control Surfaces, Score, and Advanced Editing, and then close the preferences window.
- 3** Choose Logic Pro X > Preferences > Initialize All Except Key Commands.

A confirmation message appears.

- 4** Click Initialize.

Your preferences are initialized to their default states.

If you're jumping ahead to a lesson other than Lesson 1, make sure that you select all additional options as detailed in step 2.

### **Using the U.S. Key Command Preset**

This book assumes that you are using the default initialized key command preset for a U.S. keyboard. So you may find that some of the key commands in your Logic installation do not function as they are described in this book.

If at any point you find that the key commands don't respond as described in this book, make sure the U.S. key command preset is selected on your Mac by choosing Logic Pro X > Key Commands > Presets > U.S.

## Screen Resolution

Depending on your display resolution, some of the project files may appear different on your screen than they do in the book. When you open a project, if you can't see the whole Arrange window, move the window until you can see the three window controls at the left of the title bar, and click the Zoom button (the third button from the left) to fit the window to the screen.

When using a low display resolution, you may also have to zoom or scroll more often than instructed in the book when performing some of the exercise steps. In some cases, you may have to temporarily resize or close an area of the Arrange window to complete an action in another area.

## About the Apple Pro Training Series

*Apple Pro Training Series: Logic Pro X 10.1* is both a self-paced learning tool and the official curriculum of the Apple Pro Training and Certification Program. Developed by experts in the field and certified by Apple, the series is used by Apple Authorized Training Centers worldwide and offers complete training in all Apple Pro products. The lessons are designed to let you learn at your own pace. Each lesson concludes with review questions and answers summarizing what you've learned, which can be used to help you prepare for the Apple Certified Professional—Logic Pro X Certification Exam.

For a complete list of Apple Pro Training Series books, see the ad at the back of this book or visit [www.peachpit.com/apts](http://www.peachpit.com/apts).

## Apple Pro Certification Program

The Apple Pro Training and Certification Program is designed to keep you at the forefront of Apple digital media technology while giving you a competitive edge in today's ever-changing job market. Whether you're an editor, graphic designer, sound designer, special-effects artist, or teacher, these training tools are meant to help you expand your skills.

Upon completing the course material in this book, you can become a certified Apple Pro by taking the certification exam at an Apple Authorized Training Center. Successful certification as an Apple Pro gives you official recognition of your knowledge of Apple professional applications while allowing you to market yourself to employers and clients as a skilled, pro-level user of Apple products.

For those who prefer to learn in an instructor-led setting, Apple offers training courses at Apple Authorized Training Centers worldwide. These courses, which use the Apple Pro Training Series books as their curriculum, are taught by Apple Certified Trainers and balance concepts and lectures with hands-on labs and exercises. Apple Authorized Training Centers have been carefully selected and have met Apple's highest standards in all areas, including facilities, instructors, course delivery, and infrastructure. The goal of the program is to offer Apple customers, from beginners to the most seasoned professionals, the highest-quality training experience.

For more information, please see the ad at the back of this book, or to find an Authorized Training Center near you, go to [training.apple.com](http://training.apple.com).

## Resources

*Apple Pro Training Series: Logic Pro X 10.1* is not intended as a comprehensive reference manual, nor does it replace the documentation that comes with the application. For comprehensive information about program features, refer to these resources:

- ▶ Logic Pro Help, accessed through the Logic Pro X Help menu, contains a description of most features. Other documents available in the Help menu can also be valuable resources.
- ▶ The Apple websites [www.apple.com/logic-pro/](http://www.apple.com/logic-pro/) and [www.apple.com/support/logicpro/](http://www.apple.com/support/logicpro/).
- ▶ The Logic Pro Help website, an online community of Logic users moderated by the author of this book, David Nahmani: [www.logicprohelp.com/forum](http://www.logicprohelp.com/forum).

## Time Goals

This lesson takes approximately 75 minutes to complete.

Create a new project with a Drummer track

Choose a drummer and drum kit

Edit the drummer performance

Arrange the song structure

Edit performances in the new sections

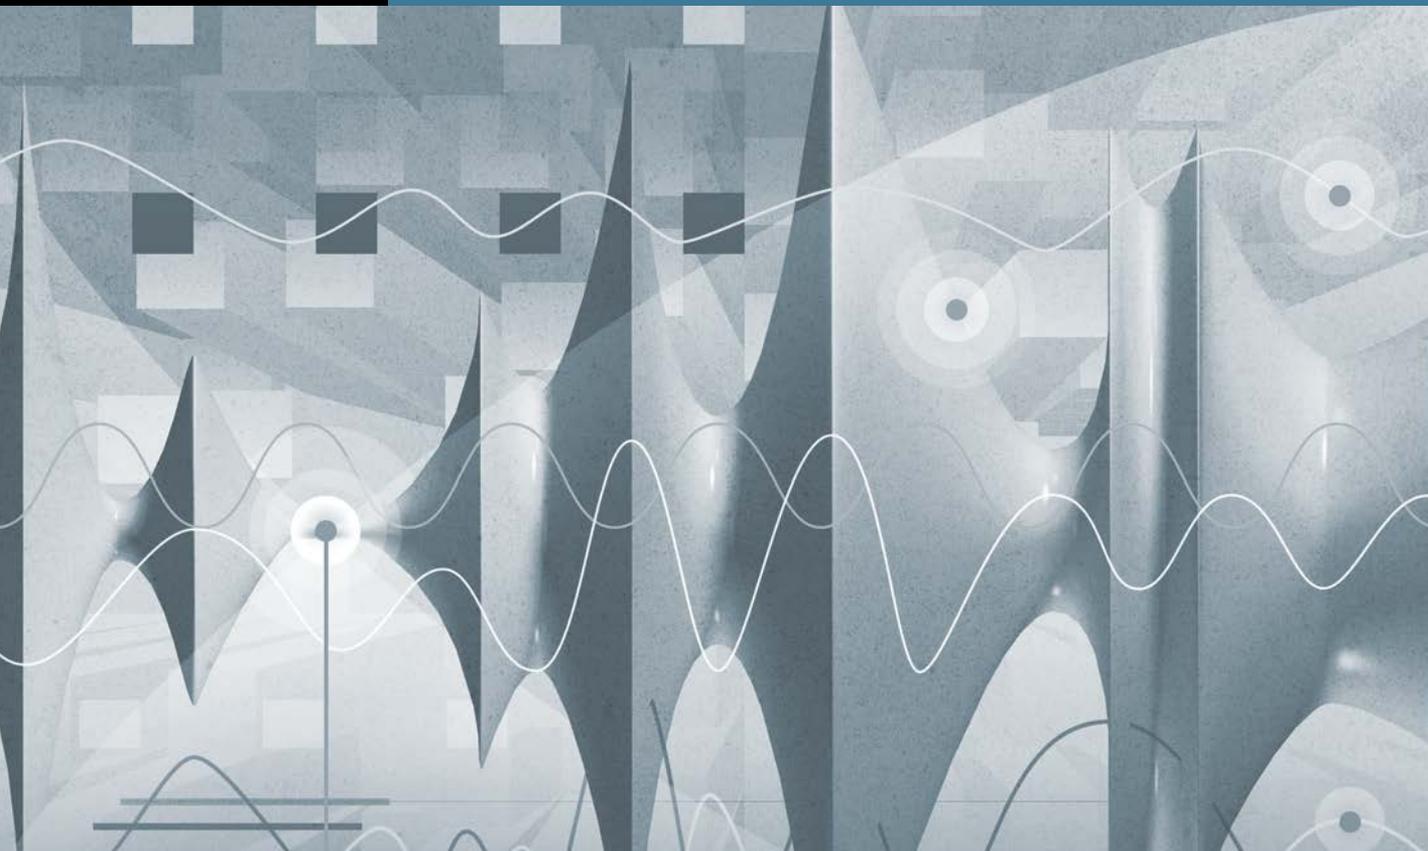

Customize the drum kit

Tune and dampen individual kit pieces

Work with electronic drummers

Customize drum machines

Convert Drummer regions to MIDI regions

## Lesson 4

# Produce a Virtual Drum Track

In most popular modern music genres, drums are the backbone of the instrumentation. They provide the foundation for the tempo and the groove of the piece. For recording sessions in which the instruments are not tracked at the same time, drums are usually recorded or programmed first so that the other musicians can record while listening to their rhythmic reference.

To meet today's high production standards, producing drum tracks usually involves using several techniques, including live recording, programming, sampling, audio quantizing, and sound replacement. In Logic Pro X, you can speed up the process by taking advantage of the new Drummer feature along with its companion software instruments, Drum Kit Designer and Drum Machine Designer.

In this lesson, you will produce virtual indie-rock, hip-hop, and electro-house drum tracks. After selecting a genre and choosing the best drummer for your project, you will adjust the drummer's performance, making her play busier patterns or simpler ones, louder or softer, and changing the feel, almost like a producer would communicate with a real drummer in a recording session.

## Creating a Drummer Track

Drummer is a new Logic Pro X feature that allows you to produce drum tracks using a virtual drummer with its own playing style. Its performance is placed in Drummer regions on a Drummer track. You edit the performance data in the regions using the Drummer Editor. The virtual drummer also has its own drum kit loaded in a software instrument plug-in called Drum Kit Designer.

First, let's open a new project, add a Drummer track, and examine the display of the drum performance in the Drummer region.

- 1 Choose File > New (or press Command-Shift-N).

A new project opens along with the New Tracks dialog.

- 2 In the New Tracks dialog, select Drummer, make sure the Genre pop-up menu is set to Rock, and click Create.

A Drummer track is created along with two eight-bar Drummer regions. At the bottom of the main window, the Drummer Editor opens, allowing you to choose a drummer and drum kit, and to edit the performance in the Drummer regions that are selected in the workspace. The track is named SoCal, which is the name of the drum kit used by the default virtual drummer in the Rock category, Kyle.

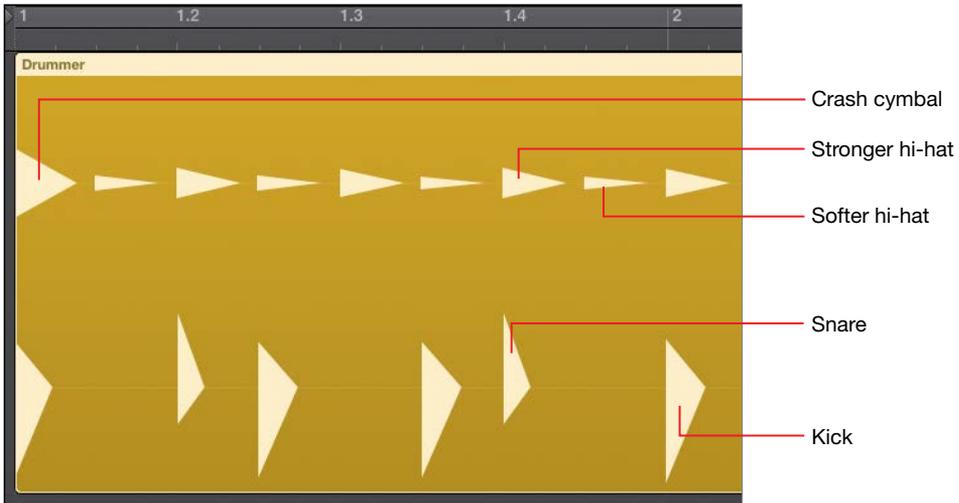

- 3 Press the Spacebar to listen to the two Drummer regions.

In the first region, the drummer starts with a crash cymbal and plays a straightforward rock pattern. At the end of the first Drummer region, a drum fill leads into the next section.

In the second region, the drummer switches from the hi-hat to the ride cymbal and plays a more complex pattern: The kick is busier, and the snare adds ghost notes (very quiet hits) between beats. As in the first region, the drummer plays a fill at the end of the first four measures, followed by a crash. He plays another fill at the end of the region.

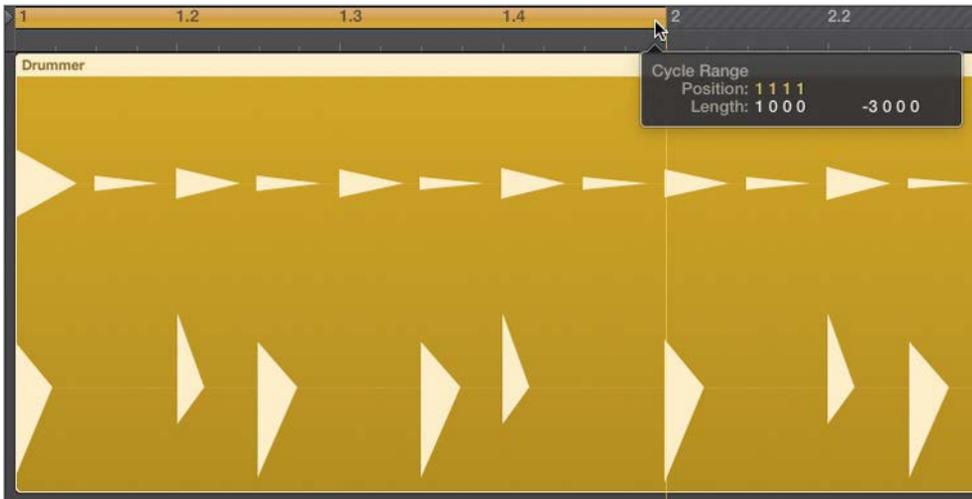

Let's take a closer look at a Drummer region.

- 4 Control-Option-drag over the first bar of the first Drummer region. If necessary, continue zooming vertically by dragging the vertical zoom slider (or pressing Command-Down Arrow) until you can see two lanes in the Drummer region.

The Drummer region displays drum hits as triangles on lanes, roughly emulating the look of drum hits on an audio waveform. Kicks and snares are shown on the bottom lane; cymbals, toms, and hand percussions are on the top lane.

- 5 In the upper half of the ruler, drag a one-measure cycle area at bar 1.

- 6 Listen to the first bar a few times while looking at the drum hits in the Drummer region.

Although you cannot edit individual drum hits in the Drummer region, the region display gives you a quick glance at the drummer's performance.

**MORE INFO** ► At the end of this lesson you will convert Drummer regions to MIDI regions. In Lesson 6, you will learn how to edit MIDI regions.

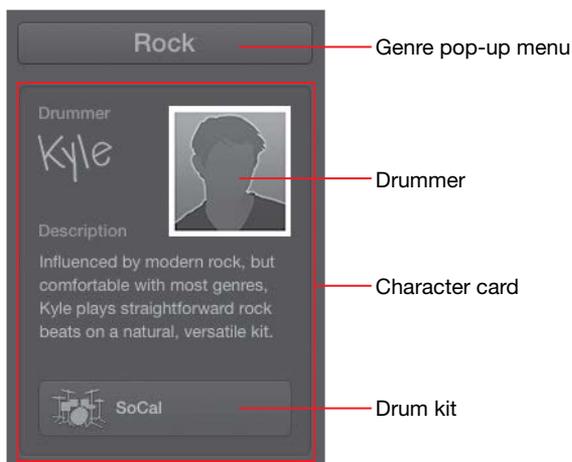

- 7 Turn off Cycle mode.
- 8 In the workspace, click the background and press Z to zoom out and see both drummer regions.

Now you can read the Drummer regions. In the next exercise, you will listen to multiple drummers and several performance presets. Later, you will zoom in again to see the Drummer regions update as you adjust their settings in the Drummer Editor.

### Choosing a Drummer and a Style

Each drummer has his own playing style and drum kit, and those combine to create a unique drum sound. Before you start fine-tuning the drummer's performance, you need to choose the right drummer for the song.

In the Drummer Editor, drummers are categorized by music genres. By default, choosing a new drummer means loading a new virtual drum kit and updating Drummer region settings; but sometimes you may want to keep the same drum kit while changing the drummer, which you will do in this exercise.

- 1 In the character card, click the drummer.  
All the drummers from the Rock category are displayed.
- 2 Place the mouse pointer over Anders (the first drummer in the second row).

A help tag describes that drummer's playing style and the sound of his drum kit. Let's get to know the other drummers.

- 3 Continue by placing the pointer over other rock drummers to read their descriptions. When you're through, click the drummer named Jesse.

In the workspace, the two Drummer regions update to display Jesse's performance.

- 4 In the workspace, click the first Drummer region (at bar 1) to select it.

The Drummer Editor shows the settings for the selected Drummer region. A yellow ruler allows you to position the playhead anywhere within the region, and you can click the Play button to the left of the ruler to preview the Drummer region. As in the Tracks area, you can also double-click the ruler to start and stop playback.

- 5 In the Drummer Editor, click the Play button.

The selected region plays in Cycle mode, and the cycle area automatically matches the region position and length. The selected region is soloed—indicated by a thin yellow frame—and the other region is dimmed. Soloing the region helps you focus on the drums when you have other tracks in the project.

Although you will later fine-tune the drummer's performance, Jesse's busy, syncopated drum patterns are not a good fit for this indie-rock song. You are looking for a drummer with a simple, straightforward style that more appropriately serves the song.

**6** Stop playback.

In the Tracks area, Cycle mode is automatically turned off, the dimmed cycle area returns to its original position and length, and the selected region is no longer soloed.

**7** In the Drummer Editor, click the Genre menu at the top of the character card, and choose Alternative.

Drummers from the Alternative category are shown.

**8** Click the first drummer, Aidan.

- 9 In the Drummer Editor, click the Play button.

While the region is playing back in Cycle mode, you can try selecting other region settings presets to explore Aidan's full range of playing style.

- 10 In the Presets column, click a few different presets while the region plays back.

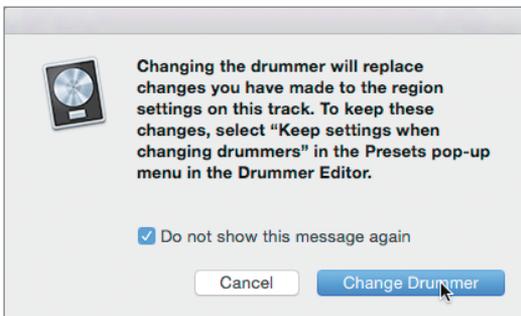

When you click a preset, the region settings update and you can hear another performance from the same drummer.

- 11 Without stopping playback, from the Genre menu, choose Rock.
- 12 Click the fourth drummer, Max.

A dialog explains how to retain region settings when changing the drummer.

- 13 In the dialog, select “Do not show this message again,” and click Change Drummer.

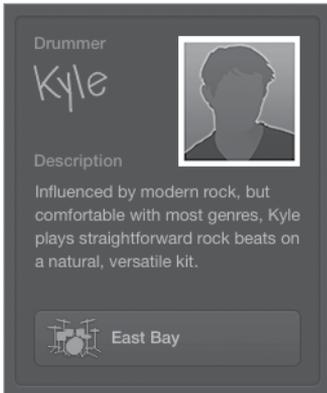

Listen to a few of Max's presets. Although Max's hyperactive performance is not what you're looking for, the drum kit sounds punchy. Let's assign the first drummer, Kyle, to play on Max's drum set, East Bay Kit.

- 14** In the character card, click the drummer to display the drummers.

You can Option-click a new drummer to select that drummer while keeping the current drum kit.

- 15** Option-click Kyle.

Kyle is now playing Max's East Bay Kit. Let's make him play a bit faster.

- 16** In the control bar, set the tempo to 142 bpm.

- 17** Stop playback.

You have found a drummer that plays the straightforward style you're seeking for this project, paired a punchy-sounding drum kit, and set a tempo that will drive your indie-rock song. You are now ready to customize the performance.

### Editing the Drum Performance

In a recording session with a live drummer, the artist, the producer, or the musical director must communicate their vision of the completed song. They may ask the drummer to play behind or ahead of the beat to change the feel of the groove, or to switch from the hi-hat to the ride cymbal during the chorus, or to play a drum fill in a specific location.

In Logic Pro X, editing a drummer performance is almost like giving instructions to a real drummer. In this exercise, you will play a drum region in Cycle mode as you adjust the drummer settings.

- 1 In the workspace, make sure the first Drummer region is still selected, and in the Drummer Editor, click the Play button.

Next to the presets, an XY pad with a yellow puck lets you adjust both the loudness and the complexity of the drum pattern.

- 2 As the region plays, drag the puck, or click different locations inside the pad, to reposition it.

**TIP** To undo your most recent Drummer Editor adjustment, press Command-Z.

After positioning the puck, you must wait for the region to update (update time varies depending on your computer). If you drag the puck constantly, the region will not update.

As you position the puck farther to the right, the drum pattern becomes more complex; and as you move the puck toward the top of the pad, the drummer plays louder. Try placing the puck in the pad's corners for extreme settings, such as soft and simple, or loud and complex.

As the drummer plays softer, he closes the hi-hat and switches from hitting the snare drum on the skin to playing rim clicks (hitting only the rim of the drum). As he plays louder, he opens the hi-hat and start playing rim shots (hitting the skin and the rim simultaneously for accent).

Let's make the drummer play a solid, straightforward beat in this first Drummer region, which will be used for the first verse of the song.

- 3 Settle for a puck position where the drummer plays a rather simple and fairly loud pattern.

You can still hear a lot of syncopation on the kick drums. To the right of the XY pad, you can choose from several Kick & Snare pattern variations.

- 4 Drag the Kick & Snare slider to position 2 (or click the second increment on the slider).

**TIP** In multitrack projects, when you select the **Follow** checkbox, a pop-up menu appears instead of the Kick & Snare slider. The menu lets you choose a track to influence what the drummer plays on the kick and snare.

The drummer now simply alternates kick and snare on every beat. If you don't hear the drummer play the snare on beats 2 and 4, slightly readjust the horizontal position of the puck in the XY pad so it's in the same position as in the figure following step 3.

Listen to the hi-hat: It is currently playing eighth notes.

- 5 Click the first increment on the Hi-Hat slider.

The hi-hat now plays only on the beat (quarter notes), which works well for up-tempo songs.

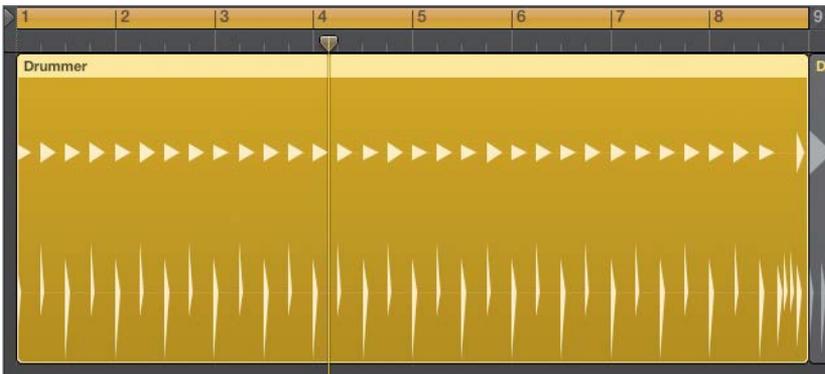

The drummer is playing a fill in the middle of the region (before bar 5) and another at the end (before bar 9). Let's get rid of the first fill and keep only one at the end.

- 6 Look at the region in the workspace while trying different positions for the Fills knob, and drag the Fills knob down until you see the fill before bar 5 disappear. You should still see a fill at the end of the region.

**NOTE** ▶ Clicking the small lock icon next to the Fills and Swing knobs locks the knob into position as you preview presets or drummers.

**TIP** ▶ Each time you adjust a setting in the Drummer Editor, the selected region is refreshed and the drummer plays a new subtle variation. Dragging the Fills knob by a tiny amount is a quick way to refresh a region. You can also click the Action pop-up menu next to the Presets menu and choose Refresh Region; or Control-click the region in the workspace, and from the shortcut menu, choose Edit > Refresh Region.

You now have a very straightforward beat. Because the drummer plays less now, he can make the hi-hat ring a bit more.

- 7 In the Drummer Editor, click the Details button to display three knobs.

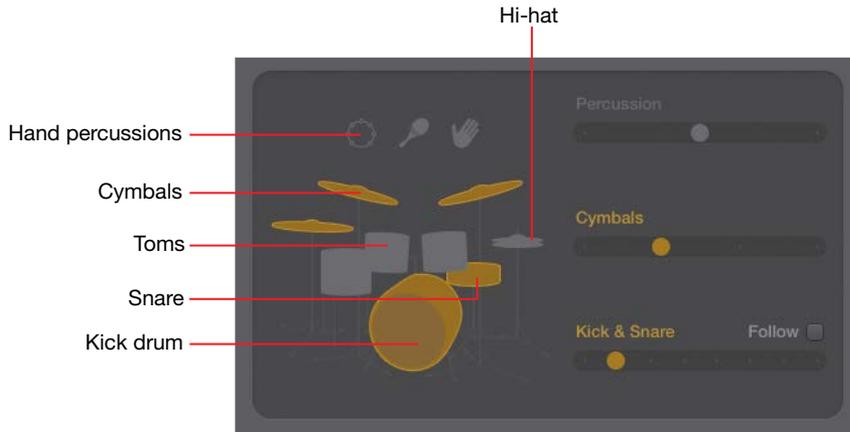

- 8 Below the Hi-Hat knob, deselect the Automatic option.
- 9 Drag the Hi-Hat knob up to open it a little bit.

This verse's drum pattern now sounds great, so let's move on to the second Drummer region, which you'll use for the chorus.

- 10 In the Drummer Editor, click the Details button to hide the three buttons.
- 11 Stop playback.
- 12 In the workspace, select the second Drummer region.

The Drummer Editor updates to show the second region's settings. On the drum kit, the hi-hat is now dimmed, while the cymbals are highlighted in yellow. The drummer no longer plays the hi-hat, but instead plays a ride or crash cymbal in that region.

- 13** In the Drummer Editor, click the Play button.

You can hear the second region in Cycle mode. The drummer is playing the ride cymbal on every eighth note. For a more powerful chorus, you instead want it to play crash cymbals on every beat.

- 14** Click the first increment of the Cymbals slider.

You now hear crash cymbals on every beat. Even for a chorus, the beat is a little too busy.

- 15** On the XY pad, drag the puck toward the left to create a simpler beat.

Let's listen to the verse going into the chorus.

**16** Stop playback.

**17** Go to the beginning of the song and listen to both Drummer regions.

You now have a simple, straightforward beat for the verse, and then the drummer switches to the crash cymbal for the busier chorus pattern.

You have carefully crafted two eight-measure drum grooves: one for the verse and one for the chorus. They are the two most important building blocks of the song you will now start arranging.

## Arranging the Drum Track

In this exercise, you will lay out the song structure and populate the Drummer track with Drummer regions for the whole song.

### Using Markers in the Arrangement Track

Using the Arrangement track, you will now create arrangement markers for all the sections of your song. You'll adjust their lengths, positions, and order, and fill all the new sections with Drummer regions.

**1** At the top of the track headers, click the Global Tracks button (or press G).

The global tracks open, with the Arrangement track at the top. You won't need the other global tracks, so you can hide them.

- Control-click a global track header, and choose Configure Global Tracks (or press Option-G).

A shortcut menu opens in which you select the global tracks you want to display.

- Deselect the Marker, Signature, and Tempo tracks, and click outside the shortcut menu to close it.

The Arrangement track is now closer to the regions in the workspace, making it easier to see their relationships.

- In the Arrangement track header, click the Add Marker button (+).

An eight-measure arrangement marker named Intro is created at the beginning of the song. By default, arrangement markers are eight bars long and are placed one after the other, starting from the beginning of the song. Let's rename the marker.

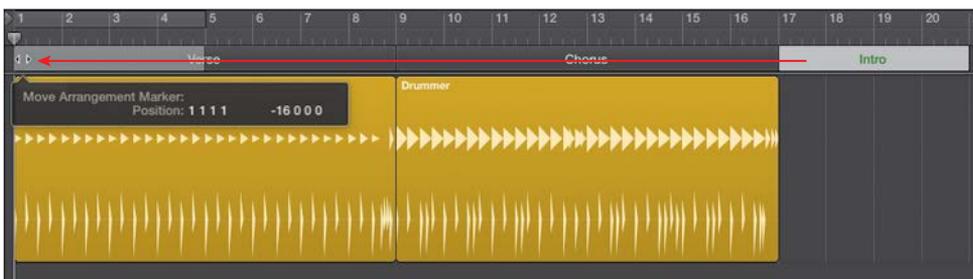

- Click the name of the marker, and from the menu, choose Verse.

- 6 Click the Add Marker button (+) to create a new marker, and make sure it's named Chorus.  
You will now create a marker for a new intro section and insert it before the Verse and Chorus markers.
- 7 In the Arrangement track header, click the Add Marker (+) button.  
An eight-bar marker is created.
- 8 Click the name of the new marker, and from the pop-up menu, choose Intro.  
A four-measure intro will be long enough, so you can resize the Intro marker before moving it.
- 9 Drag the right edge of the Intro marker toward the left to shorten it to four bars.

- 10 Click the marker away from its name (to avoid opening the Name pop-up menu), and drag the Intro marker to bar 1.

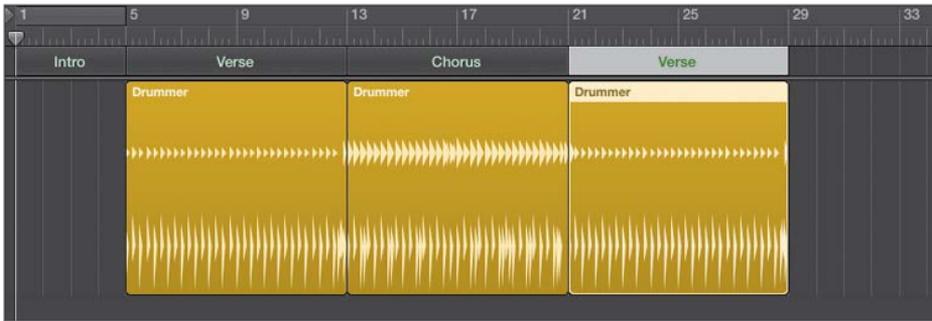

The Intro marker is inserted at bar 1, and the Verse and Chorus markers move to the right of the new Intro section. In the workspace, the Drummer regions move along with their respective arrangement markers.

As with regions in the workspace, you can Option-drag a marker to copy it.

- 11 Press Command-Left Arrow to zoom out horizontally and make space to the right of the existing song sections. Option-drag the Verse marker to bar 21, right after the chorus.

The Verse marker and the Drummer region are copied together.

- 12 Option-drag the Chorus marker to bar 29, after the second verse.

The Chorus and the Drummer region are copied together.

The song is taking shape. You will now finish arranging the song structure with a bridge, a chorus, and an outro section. As you place the last three markers, continue zooming out horizontally as necessary.

- 13 In the Arrangement track header, click the Add Marker (+) button.

A Bridge marker is created after the last chorus.

- 14 In the Arrangement track header, click the Add Marker (+) button two more times to create markers for the Chorus and Outro sections.

- 15 Make sure the two last markers have the correct names, Chorus and Outro.

Let's shorten the outro section a bit.

- 16** Resize the Outro marker to make it four bars long.

The song structure is now complete, and you can add Drummer regions to fill out the empty sections.

- 17** On the Drummer track, Control-click the background and choose **Populate with Drummer Regions**.

New Drummer regions are created for all the empty arrangement markers.

- 18** Listen to the drum track, focusing on the new sections.

New patterns were automatically created for each new Drummer region.

**TIP** To delete all the regions below an Arrangement marker, select the marker, and press **Delete**. To remove the Arrangement marker, press **Delete** again.

Amazing as the playing is, Kyle (the drummer) might not have guessed what you had in mind for each section. You will now edit some of the new regions to adjust the drummer's performance.

### Editing the Intro Drum Performance

In this exercise, you will make the drummer play the hi-hat instead of the toms. Later, you'll cut the Intro region in two so that you can use different settings for the second part of the intro and make the drummer play a progressively louder and more complex pattern.

- 1 In the workspace, click the background to deselect all regions, and click the Intro region to select it.

The Drummer Editor shows its settings.

Throughout this exercise you can click the Play button in the Drummer Editor to start and stop playback, or you can navigate the workspace by pressing the Spacebar (Play or Stop) and the Return key (Go to Beginning).

- 2 Listen to the Intro.

Let's make the drummer play the hi-hat instead of the toms.

- 3 In the Drummer Editor, click the hi-hat.

When you click the hi-hat, the toms are muted automatically. Aside from the kick and snare, the drummer can focus on the toms, the hi-hat, or the cymbals (ride and crash).

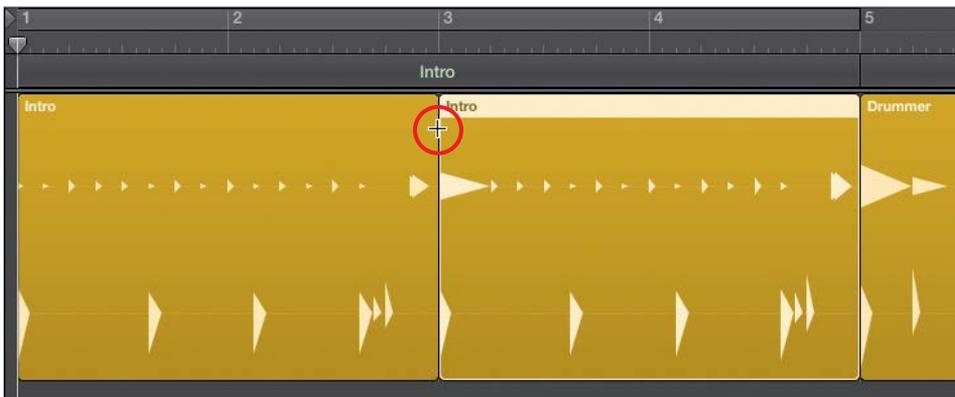

The drums are still a little too loud and busy for this intro.

- 4 In the XY pad, drag the puck toward the bottom left.

The drums are softer, but the transition into the first verse at bar 5 is a little abrupt. Making the drums play crescendo (increasingly louder) during the intro will help build up some tension leading into that verse. To make the loudness evolve throughout the intro, you will cut the Intro region in two.

- 5 Stop playback.
- 6 Hold down Command to use the Marquee tool, and double-click the Intro region at bar 3.

The region is divided into two two-measure regions. When a region is divided, the drummer automatically adapts his performance, and plays a fill at the end of each new region.

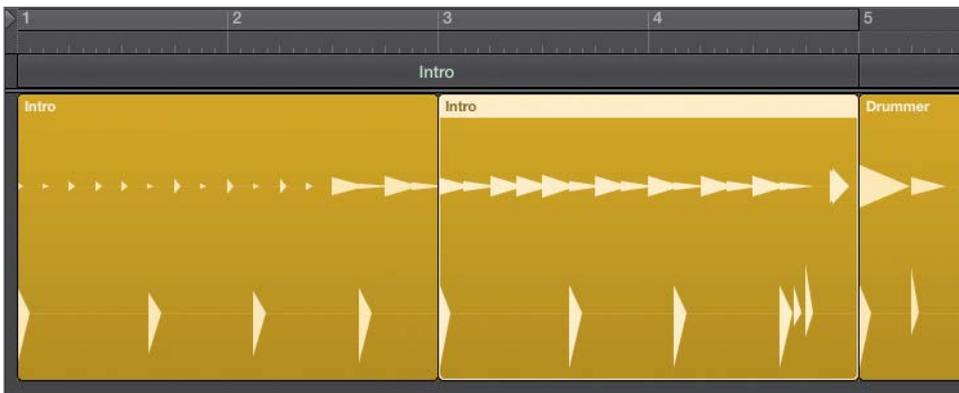

- 7 Select the first Intro region.
- 8 In the Drummer Editor, drag the Fills knob all the way down.

Notice how the crash disappears from the first beat of the following region. Even though it is in another region, the crash is actually a part of the fill. Now let's create the crescendo.

- 9 Select the second Intro region, and in the XY pad, drag the puck up to make the drummer play louder.

- 10 Listen to the whole intro going into the first verse.

The drummer automatically starts playing louder before the end of the first intro region, which transitions into the louder second region and creates a nice tension at

the start of the song. At bar 5, a crash punctuates the fill at the end of the intro. The straightforward groove continues in the Verse section, with the hi-hat a little less open to leave space to later add a singer.

### Editing the Bridge Drum Performance

In a song, the bridge serves to break the sequence of alternating verses and choruses. Often, the main idea of the song is exposed in the choruses, and verses help support or develop that statement. The bridge can present an alternate idea, a different point of view. Departing from the main idea of the song increases the listener's appreciation for returning to the chorus at the end of the song—almost like taking a vacation can increase your appreciation for going back home.

For this fast, high-energy indie-rock song, a quieter bridge in which the instruments play softer will offer a refreshing dynamic contrast. Playing softer does not mean the instruments have to play less, however. In fact, you will make the drums play a busier pattern during this bridge.

- 1 Listen to the Bridge region.

**TIP** When pressing the Spacebar to play a section, you can use Cycle mode to ensure that playback always starts at the beginning of the section. Drag a section's arrangement marker into the ruler to turn on Cycle mode and create a cycle area that matches the section.

The drummer plays at the same level as in the previous sections, but he plays more here. You need to bring down the energy level.

- 2 Select the Bridge Drummer region.
- 3 In the XY pad, position the puck farther down and all the way to the right.

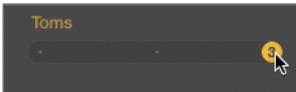

The drummer is still playing a lot, but he's much quieter. To take this bridge into a different tonal direction, you want Kyle to play toms.

- 4 On the drum kit, mute the snare and unmute the toms.

The hi-hat is muted automatically when you unmute the toms.

Let's choose a busier pattern for the toms.

- 5 On the Toms slider, click increment 3.

Kyle is now playing sixteenth notes on the toms, which creates a mysterious vibe similar to tribal percussion.

Kyle plays slightly ahead of the beat during the bridge. However, the timing nuance is subtle, and it's difficult to hear without other instruments to compare with Kyle's timing. Let's turn on the metronome and experiment with the feel of the performance.

- 6 In the control bar, click the Metronome button (or press K).
- 7 In the Drummer Editor, click the Details button to display the three setting knobs.

- 8 Try setting different positions of the Feel knob, and then listen to the results.

Listen to the way the drums play compared to the metronome. Don't be afraid to drag the Feel knob all the way up or down to hear the effect of extreme Feel settings.

- ▶ Dragging the Feel knob toward Push makes the drummer play ahead of the beat. He sounds as if he's rushing, thereby creating a sense of urgency.
- ▶ Dragging the Feel knob toward Pull makes it play behind the beat. He sounds as if he's lazy or late, and the groove is more relaxed.

Settle on a Feel knob position more toward Pull to realize a reasonably relaxed groove.

- 9 Click the Details button to hide the three setting knobs.

- 10 Turn off Cycle mode.

- 11 In the control bar, click the Metronome button (or press K) to turn it off.

You have radically changed the drummer's performance in that region. Kyle now plays the bridge with a busy tribal pattern on the toms. He uses restraint, hitting softly and behind the beat, with a slight crescendo toward the end. The quiet and laid-back yet complex drum groove brings a welcome pause to an otherwise high-energy drum performance, and builds up tension leading into the last two sections.

### Editing the Chorus and Outro Sections

You will now finish editing the drummer's performance by adjusting the settings of the last two Chorus and Outro Drummer regions in your workspace.

- 1 Select the Chorus region after the bridge and listen to it.

That Chorus region was created when you populated the track with Drummer regions earlier in this lesson. It doesn't have the same settings as the previous two choruses and sounds busier, except for Kyle playing the ride cymbal instead of the crash.

- 2 On the Cymbals slider, click the first increment.

The drummer now plays the crash, and this last chorus is more consistent with the previous two choruses.

- 3 Select the Outro region at the end of the track and listen to it.

The drummer plays a loud beat, heavy on the crash, which could work for an outro. You will, however, make it play double-time (twice as fast) to end the song in a big way.

- 4 On the Kick & Snare slider, click the last increment (8).

Now it sounds like you've unleashed Kyle! Playing double-time at that fast tempo makes the sixteenth notes on the kick drum sound ridiculously fast.

- 5 On the XY pad, drag the puck toward the left until the drummer stops playing sixteenth notes on the kick drum.

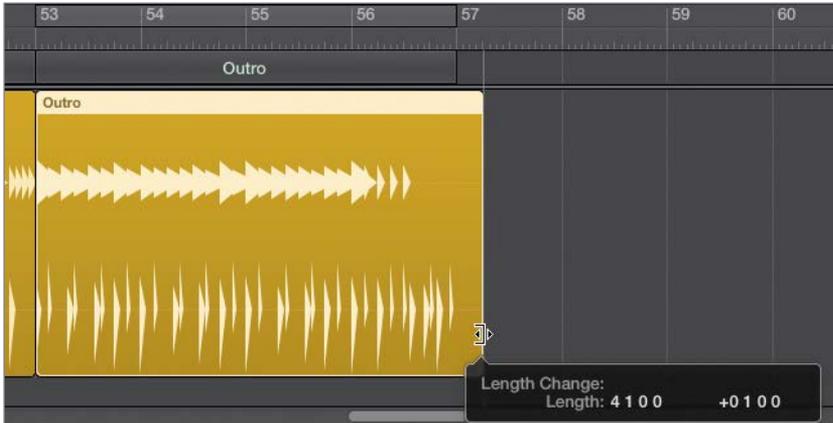

The performance now sounds more realistic while retaining the driving effect of its double-time groove.

- 6 Listen to the last chorus and the outro.

The outro has the required power to drive the last four measures; however, it seems like the drummer stops abruptly before finishing the fill. Usually drummers end a song by playing the last note on the first beat of a new bar, but here a crash cymbal is missing on the downbeat at bar 57. You will resize the last Outro region in the workspace to accommodate that last drum hit.

- 7 Resize the last Outro region to lengthen it by one beat (until the help tag reads Length: 4 1 0 0 +0 1 0 0).

A moment after you release the mouse button, the Drummer region updates, and you can see a kick and a crash on the downbeat at bar 57.

- 8 Listen to the outro. The drummer finishes the fill, punctuating it with the last hit at bar 57.

**NOTE** ► The final crash cymbal continues ringing until its natural sustain fades out, well after the playhead has passed the end of the last Outro region.

You've laid out the entire song structure by creating section markers in the arrangement track, populated each section with Drummer regions, and edited each region's settings to customize its drum pattern. You are now done editing the drum performance and can focus on the sound of the drums.

## Customizing the Drum Kit

When recording a live drummer in a studio, the engineer often positions microphones on each drum. This allows control over the recorded sound of each drum, so he can individually equalize or compress the sound of each kit piece. The producer may also want the drummer to try different kicks or snares, or to experiment with hitting the cymbals softer before he begins recording.

In Logic, when using Drummer, the sounds of each drum are already recorded. However, you can still use several tools to customize the drum kit and adjust the sound of each drum.

### Adjusting the Drum Levels Using Smart Controls

Smart Controls are a set of knobs and switches that are premapped to the most important parameters of the plug-ins on the channel strip of the selected track. You will study Smart Controls in more detail in Lesson 5.

In this exercise, you will use Smart Controls to quickly adjust the levels and tones of different drums. Then you'll open Drum Kit Designer to swap one snare for another and fine-tune the crash cymbal sound.

- 1 In the control bar, click the Smart Controls button (or press B).

The Smart Controls pane opens at the bottom of the main window, replacing the Drummer Editor. It is divided into three sections: Mix, Compression, and Effects.

In the Mix section, six knobs allow you to balance the levels of the drums. To the right of each knob, a button lets you mute the corresponding drum or group of drums.

- 2 Position the playhead before the first chorus and start playback.

- 3 Turn the cymbals down a bit by dragging the Cymbals knob.

Even with the Amount knob turned all the way down in the Compression section, the compressor is still slightly processing the drum sound. Let's turn it off.

- 4 In the Compression section, click the On button.

On the left channel strip in the inspector, the Compressor plug-in is dimmed, indicating that it is turned off.

- 5 In the Effects section, drag the Tone knob up.

As you drag up the knob, the drums' sound changes timbre and becomes brighter. On the left channel strip in the inspector, the EQ curve on the channel strip's EQ display reflects the changes made to the Channel EQ plug-in.

**MORE INFO** ▶ You will further examine the Channel EQ plug-in in Lesson 9.

- 6 Drag up the Room knob.

As you drag up the knob, you will start hearing the subtle reverberation of a drum booth. In the inspector, you can see the Bus 1 Send knob move along with the Tone knob.

**MORE INFO** ► You will learn how to use bus sends to route an audio signal to a reverb and to change the character of the reverb in Lesson 9.

- 7 In the control bar, click the Editors button (or press E) to open the Drummer Editor.

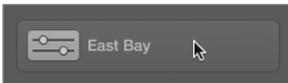

**TIP** ► You can also double-click a Drummer region to open the Drummer Editor.

You have adjusted the levels and timbres of the drums, and you're now ready to fine-tune the sound of the individual drum kit pieces.

### Customizing the Kit with Drum Kit Designer

Drum Kit Designer is the software instrument plug-in that plays drum samples triggered by Drummer. It allows you to customize the drum kit by choosing from a collection of drums and cymbals and tuning and dampening them.

- 1 At the bottom of the character card, click East Bay Kit to open Drum Kit Designer.

**TIP** ► To have the Drummer regions play a different instrument, you can choose another patch from the Library or insert another software instrument plug-in on the channel strip. You can also drag Drummer regions to another software instrument track, and they are automatically converted to MIDI regions. (You will learn more about MIDI in Lesson 5.)

- 2 In Drum Kit Designer, click the snare.

You can hear the snare sample. The snare stays lit, and the rest of the drum kit is in shadow. To the left, a Snare panel contains your choice of three snare drums, and to the right, an Edit panel includes three setting knobs.

The left panel shows only a limited selection of snares. To gain access to the entire collection of drum samples included with Logic Pro X, you need to choose a Producer Kit in the Library.

**TIP** To trigger Drum Kit Designer from your iPad in Logic Remote, tap the View menu and then tap Kits (you will learn how to use the Logic Remote in Lesson 5).

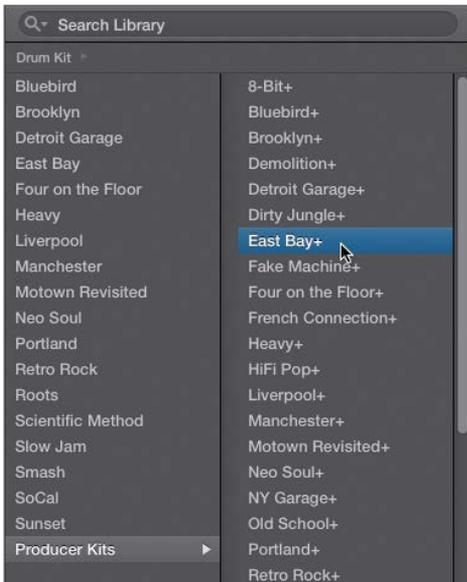

- 3 In the control bar, click the Library button (or press Y).

To the left of the inspector, the Library opens, listing patches for the selected track. The current patch, East Bay, is selected.

- 4 In the Library, select Producer Kits, and then select East Bay+.

The Drum Kit Designer window is reset.

**MORE INFO** ► If the plug-in window now displays an EQ plug-in, close the plug-in window, and click the button at the bottom of the character card to open the East Bay+ Drum Kit Designer window.

The East Bay+ kit sounds the same as East Bay but allows a wide array of options to customize the drum kit and its mix.

**MORE INFO** ► In the track header, you may have noticed that the drum icon is now framed in a darker rectangle with a disclosure triangle: The track is now a Track Stack that contains one track for each microphone used to record the drum kit. Clicking the disclosure triangle displays the individual tracks and their channel strips. You will use Track Stacks in Lesson 5.

- 5 Click the Library button (or press Y) to close the Library window.
- 6 In Drum Kit Designer, click the snare.

This time the left pane displays a choice of 15 snare drums (use your mouse to scroll down the list). The current snare, Black Brass, is selected.

- Click another snare, and then click the Info button next to it.

A description of the selected snare opens.

Continue previewing different snares, and try listening to a verse or a chorus to hear your customized drum kit in action.

- At the top of the left pane, click the Bell Brass snare.
- In Drum Kit Designer, click the kick drum.

The info pop-up window updates to show you information on the selected kick drum.

Listen to the kick drum. This kick is the right choice for your song, but it has a long resonance. Typically, the faster the tempo of the song, the less resonance you want on the kick; otherwise, low frequencies build up and could become a problem during the mix. You may have seen drummers stuff an old blanket in their kick drum to dampen them. In Drum Kit Designer, you only have to raise the dampening level.

- 10** In the right pane, drag the Dampen knob up to about 75%, and click the kick to listen to it.

The kick's resonance is shortened.

You will now tune the toms, which are mainly used in the bridge section.

- 11** In the workspace, select the Bridge region.
- 12** In the Drummer Editor, click the Play button and mute the kick.

You can hear only the low and mid toms.

- 13** In Drum Kit Designer, click one of the toms.

The Edit panel opens with four tabs: All (for adjusting settings of all three toms in the kit together); and Low, Mid, and High (for adjusting settings of each individual tom).

- 14** Click the Mid tab and raise the Tune knob to around +155 cent.

You can hear the mid tom being pitched up as Kyle continues repeating the first half of the bridge.

If you want, feel free to continue exploring Drum Kit Designer and adjusting the sound of the hi-hat, ride, and crash cymbals.

**15** Stop playback and close the Drum Kit Designer window.

You have exchanged the snare for another one that sounds a little clearer, dampened the kick drum to tame its resonance, and tuned the mid tom to pitch it a bit higher. You have now fully customized both the drum performance and the drum kit.

## Working with an Electronic Drummer

When drum machines first made their appearance in recording studios, drummers feared for their careers. The eighties produced a number of hit songs in which live drummers were replaced by electronic drums programmed by music producers.

However, many producers quickly realized that to program exciting electronic drum beats, they needed to develop the chops of a real drummer, while others simply chose to hire drummers for this task. In Logic, you can use Drummer to create virtual drum machine performances, turning beat creation into a fast and fun exercise.

### Creating Hip Hop Beats

In this exercise, you will work with one of the Hip Hop drummers, adjusting its feel to control the human quality in the timing, and later you'll convert the Drummer region to a MIDI region to exercise complete control over each individual drum hit.

- 1** In the Drummer Editor, from the Genre pop-up menu, choose Hip Hop.
- 2** Select the last drummer, Maurice.

In the inspector, the Drum Kit Designer plug-in is replaced by Drum Machine Designer. The Drummer Editor updates to display drum machine samples. On the track, all the Drummer regions are refreshed to reflect Maurice’s playing style.

**3** Listen to a few sections.

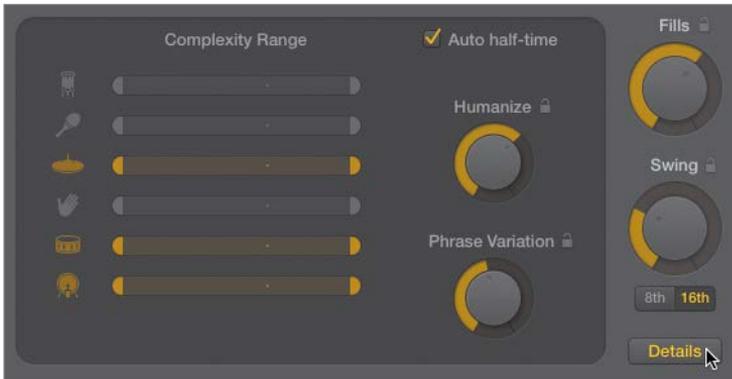

Maurice plays a very loose, swung hip-hop groove. Your project tempo is still set to 142 bpm, but the drummer plays half time, so it sounds like 71 bpm. Let’s work with the verse.

**4** Drag the first Verse Arrangement marker to the ruler.

Cycle mode is on, and the cycle area corresponds to the Verse marker.

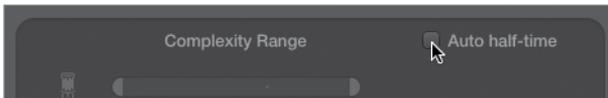

**5** Select the Drummer region below the cycle area, and press Z to zoom in.

**6** In the Drummer Editor, click the Details button.

When the “Auto half-time” checkbox is selected, the drummer automatically switches to half time when the project tempo is 110 bpm or faster; those fast tempos are rarely used in hip-hop.

**7** Deselect “Auto half-time.”

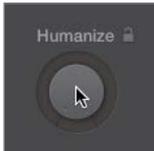

The drummer now plays at 142 bpm, which is much too fast for hip-hop.

- 8** In the LCD display, set the tempo to 87 bpm.

Maurice plays a very loose, almost sloppy beat. Let's tighten the performance.

- 9** Turn the Humanize knob all the way down.

The groove is now machine tight.

- 10** Turn the Swing knob up to 66%.

The drummer swings a little more, making the beat bouncier. Except for the fills at the end of the fourth and eighth bars in the region, it keeps repeating a fairly similar pattern. Let's make it vary the pattern a little more.

- 11** Turn the Phrase Variation knob all the way up.

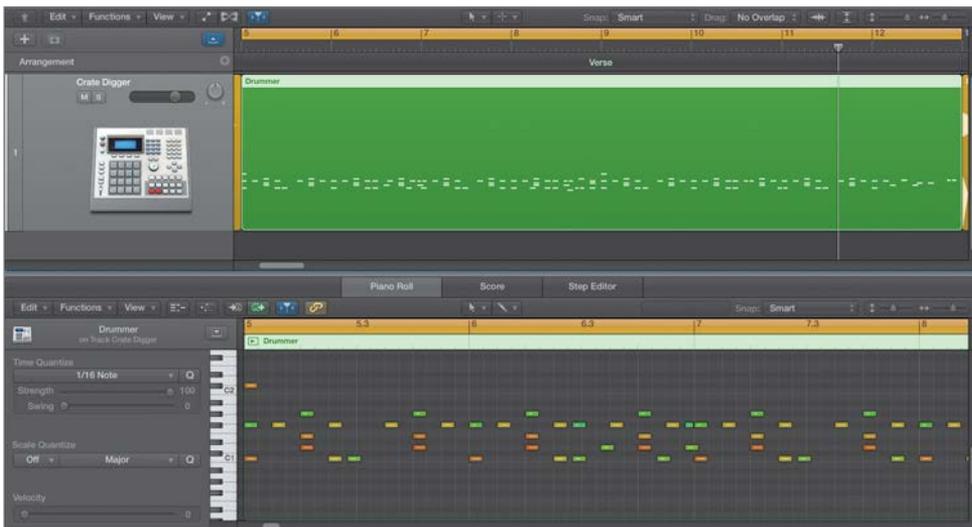

Now the beat is slightly different in every bar.

Let's get rid of the crash cymbal on the first downbeat. Since the Drummer Editor doesn't give you complete control over every single drum hit, you need to convert the Drummer region to a MIDI region.

- 12** In the workspace, Control-click the selected Drummer region and choose Convert to MIDI Region.

The yellow Drummer region is replaced by a green MIDI region that plays the same performance. The Drummer Editor is replaced by the Piano Roll Editor.

In the Piano Roll, the notes are represented by beams on a grid. The beams are positioned across a vertical piano keyboard that shows the MIDI note pitches. However, when working with drums, MIDI note pitches do not help identify the sound of the drums represented by each beam.

- 13** In the Piano Roll, choose View > Drum Names.

The vertical piano keyboard disappears, and the names of the drums are displayed in front of the grid.

- 14** On the downbeat of bar 5, click the note representing the Crash cymbal.

- 15** Press Delete to delete the selected note.

The crash cymbal is no longer triggered at the beginning of the verse.

You have replaced the acoustic drummer with an electronic drummer, adjusted the number of variations he plays, and made his playing sound tighter. Finally, you converted a Drummer region to a MIDI region to delete a single crash cymbal. In the next exercise, you'll explore the remaining parameters of the electronic Drummer Editor.

### Creating an Electro-House Track

When working with Drum Machine Designer, the Drummer Editor allows you to restrict the complexity range of individual samples, making it possible to have, for example, a simple kick and snare beat while another sample follows a more complex pattern.

You will now switch drummers to create an electro-house drum track, and you'll create a ubiquitous four-on-the-floor kick and snare beat with a complex shaker pattern.

- 1 On the Drummer track, Control-click the MIDI region and choose Convert to Drummer Region.

In the Drummer region, the crash at the beginning of the region reappears: When you convert a MIDI region to a Drummer region, the region reverts to the Drummer performance you had before converting the region to MIDI.

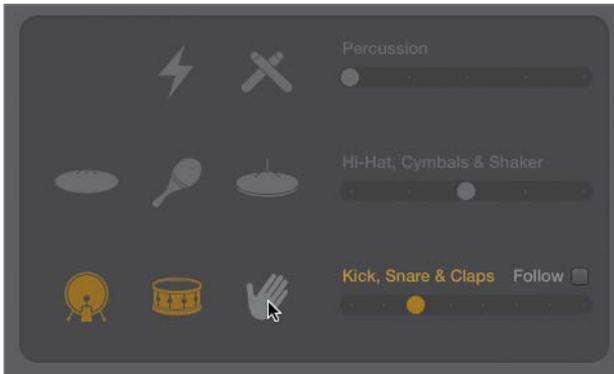

- 2 In the Drummer Editor, from the Genre pop-up menu, choose Electronic.
- 3 Select the first drummer, Magnus.

- 4 In the control bar, change the tempo to 132.
- 5 Listen to the verse.

You hear a rather straightforward dance groove. You will first work on the kick and snare beat.

- 6 In the Drummer Editor, click the Details button to go back to the basic view; and mute the shaker, hi-hat, and handclaps.

Only the kick and snare are playing. On the upper line in the Drummer region, a secondary kick plays every bar. Let's get rid of it.

- 7 In the XY pad, drag the puck to the left until the secondary kick disappears.

Now the snare may no longer play on beats 2 and 4 of every bar. You can fix that by adjusting its complexity range.

- 8 In the Drummer Editor, click the Details button.

You can drag the Complexity Range sliders for each individual drum piece to offset the complexity set by the puck in the XY pad.

- 9 Drag the snare's left Complexity Range slider toward the right until you hear the snare play on beats 2 and 4 of every bar.

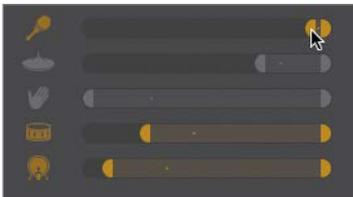

Let's add a shaker to the party.

- 10 Click the shaker to unmute it.

The shaker plays a sixteenth note pattern, and it drops for a whole beat on beat 3 of bars 5, 7, 9, and 11. You are looking for a more consistent shaker groove.

- 11 Drag the shaker's left Complexity Range slider all the way to the right.

The shaker now plays the same sixteenth note pattern throughout the region.

After exploring the Complexity Range sliders, you now have a solid understanding of all the parameters in the Drummer Editor used by electronic drummers. It's now time to move on to the drum machine itself so you can customize the drum sounds.

### Customizing the Drum Machine Sounds

Now that you're happy with the drummer performance, you can open Drum Machine Designer to adjust the mix, change the snare sample, tune it, and add some reverb.

- 1 At the bottom of the character card, click the Plug-in button.

Plug-in button

The Drum Machine Designer interface opens.

The Drum Machine Designer interface consists of two parts:

Drums cells (at the top) to select and trigger individual drum samples.

Smart Controls (at the bottom) to adjust various parameters.

**TIP** To trigger Drum Machine Designer from your iPad, in Logic Remote, tap the View menu and then tap Drum Pads. (You will learn how to use the Logic Remote in Lesson 5.)

- 2 In the Mix section, turn up the Perc & Shakers knob.

The shaker sounds a little louder.

- 3 In the Effects section, try turning up the Pulse and turning down the High Cut Filter.

The Pulse knob controls a pulsating filter that affects the shaker pattern, whereas the High Cut Filter knob muffles the entire kit.

**TIP** To determine which plug-in a knob controls, Control-click the knob and choose Open Plug-in Window.

- 4 Click the buttons next to the Pulse and High Cut Filter knobs.

Both effects are turned off, and you can hear the full frequency range of the drum sounds.

**NOTE** ▶ You will learn how to record knob movements in Lesson 10.

- 5 At the upper right of the Smart Controls, click the Sends button.

The Smart Controls display knobs that control the amount of delay and reverb for different drum kit elements.

- 6 In the Group Reverb section, turn Snare & Claps all the way up.

You can hear a short reverb added to the snare; however, that's not the type of reverb sound you're after. You will later find a more suitable reverb for this snare, so let's turn that one down.

- 7 Turn Snare & Claps all the way down.

You will now swap the kit piece patch for the Snare.

- 8 Click the Snare 1 cell.

The Snare 1 cell is selected, and the Smart Controls update to display knobs affecting that cell.

**TIP** At the top of Drum Machine Designer, click the drum machine icon to return to the main Smart Controls.

- 9 In the Snare 1 cell, click the S button.

The snare is soloed.

- 10 Open the Library.
- 11 Choose Snare 2 – Analog Circuits.

In Drum Machine Designer, the cell displays the new patch name.

- 12 In the Smart Controls, turn the Pitch knob down to A2.
- 13 Turn the Length knob down to shorten the snare sound.

In the inspector, the right channel strip controls the sound of the selected cell in Drum Machine Designer. Let's add the desired reverb to the snare.

- 14 On the right channel strip in the inspector, click the first empty Audio FX insert in the Snare 2 cell, and choose Reverb > PlatinumVerb.
- 15 In the PlatinumVerb window, from the Settings menu, choose Live Club.

**16** In PlatinumVerb, drag the Wet slider up to increase the amount of reverb.

**17** In Drum Machine Designer, click the S button in the Snare 2 cell to turn solo off.

You have adjusted the kit mix, played with some main effects, swapped one of the drum samples, adjusted its sound, and added a plug-in to its channel strip to get the sound you wanted.

You have produced drums for a whole song, and you've learned many ways to edit the drummer's performance and change the feel. You also customized drum kits to get your desired sound. With Drummer, Drum Kit Designer, and Drum Machine Designer, Logic Pro X allows you to quickly lay down a rhythmic foundation for a wide range of modern music genres.

## Lesson Review

1. How do you choose a drummer?
2. How do you choose a new drummer while keeping the current drum kit?
3. Where do you edit Drummer regions?
4. How do you mute or unmute drum parts?
5. How do you make the drummer play softer or louder, simpler or more complex?
6. How do you access the Feel knob to make the drummer play behind or ahead of the beat?
7. How do you open Smart Controls?
8. How do you open Drum Kit Designer or Drum Machine Designer?
9. When customizing an acoustic drum kit, how can you access all the available drum kit pieces?
10. How do you dampen or tune an individual drum?

11. How do you convert Drummer regions to MIDI regions?
12. How do you swap samples in Drum Machine Designer?
13. How can you use audio effect plug-ins for an individual cell in Drum Machine Designer?

### **Answers**

1. Click the drummer in the character card, or from the Genre pop-up menu, choose a genre and then click the desired drummer.
2. Option-click the desired drummer.
3. In the Drummer Editor at the bottom of the main window
4. Click the drum parts in the drum kit that is displayed in the Drummer Editor.
5. Move the puck on the XY pad.
6. Click the Details button at the bottom right of the Drummer Editor.
7. Click the Smart Controls button in the control bar, or press B.
8. Click the Plug-in button at the bottom of the character card.
9. Select the appropriate Producer Kit in the Library.
10. In Drum Kit Designer, click a drum and adjust the settings in the Edit panel.
11. Select the regions, Control-click one of them, and choose Convert > Convert to MIDI Region.
12. Click a cell and choose a new sample in the Library.
13. Click a cell and insert your plug-in on the right channel strip in the inspector.
