# Dedication

*To Kim Sekas and Stacie Fuss from my morning workout crew in the Supernatural VR headset. Any time that I started posting irrelevant Excel analyses, they would remind me that I had chapters to update.*

—Bill Jelen

# Contents at a Glance

	Acknowledgments	xix
	About the author	xxi
	Introduction	xxiii
CHAPTER 1	Pivot table fundamentals	1
CHAPTER 2	Creating a basic pivot table	11
CHAPTER 3	Customizing a pivot table	43
CHAPTER 4	Grouping, sorting, and filtering pivot data	77
CHAPTER 5	Performing calculations in pivot tables	123
CHAPTER 6	Using pivot charts and other visualizations	151
CHAPTER 7	Analyzing disparate data sources with pivot tables	177
CHAPTER 8	Sharing dashboards with Power BI	205
CHAPTER 9	Using cube formulas with the Data Model or OLAP data	223
CHAPTER 10	Unlocking features with the Data Model and Power Pivot	259
CHAPTER 11	Analyzing geographic data with 3D Map	291
CHAPTER 12	Enhancing pivot table reports with macros	307
CHAPTER 13	Using VBA or TypeScript to create pivot tables	327
CHAPTER 14	Advanced pivot table tips and techniques	395
CHAPTER 15	Dr. Jekyll and Mr. GetPivotData	441
CHAPTER 16	Creating pivot tables in Excel Online	459
CHAPTER 17	Pivoting without a pivot table using formulas, Python, or Power Query	471
CHAPTER 18	Using Artificial Intelligence and Copilot for building pivot tables	491
CHAPTER 19	Unpivoting in Power Query	543
	Afterword	559
	Index	561

# Contents

<i>Acknowledgments</i> .....	<i>xix</i>
<i>About the author</i> .....	<i>xxi</i>
<i>Introduction</i> .....	<i>xxiii</i>
<b>Chapter 1 Pivot table fundamentals</b> .....	<b>1</b>
Why you should use a pivot table .....	2
When to use a pivot table .....	3
Anatomy of a pivot table .....	4
Values area .....	4
Rows area .....	5
Columns area .....	5
Filters area .....	6
Pivot tables behind the scenes .....	7
Pivot table backward compatibility .....	7
A word about compatibility .....	8
Next steps .....	9
<b>Chapter 2 Creating a basic pivot table</b> .....	<b>11</b>
Format your source data before creating a pivot table .....	12
Ensuring that data is in a Tabular layout .....	12
Avoiding storing data in section headings .....	12
Avoiding repeating groups as columns .....	13
Eliminating gaps and blank cells in the data source .....	14
Applying appropriate type formatting to fields .....	14
Summary of good data source design .....	14
How to create a basic pivot table .....	19
Adding fields to a report .....	22
Fundamentals of laying out a pivot table report .....	23
Adding layers to a pivot table .....	25
Rearranging a pivot table .....	25
Creating a report filter .....	28

Understanding the Analyze Data, Copilot, and Recommended PivotTable features .....	28
Using slicers to filter your report .....	30
Creating a standard slicer .....	30
Creating a Timeline slicer .....	33
Keeping up with changes in the data source .....	35
Dealing with changes made to the existing data source .....	35
Dealing with an expanded data source range due to the addition of rows or columns .....	36
Sharing the pivot cache or creating a new cache .....	36
Side effects of sharing a pivot cache .....	37
Saving time with PivotTable tools .....	38
Deferring layout updates .....	38
Starting over with one click .....	39
Relocating a pivot table .....	39
Show Details for any cell in the values area .....	40
Next steps .....	41
<b>Chapter 3 Customizing a pivot table</b> .....	<b>43</b>
Making common cosmetic changes .....	44
Applying a table style to restore gridlines .....	45
Changing the number format to add thousands separators .....	46
Replacing blanks with zeros .....	47
Changing a field name .....	48
Making report layout changes .....	50
Using the Compact layout .....	51
Using the Outline layout .....	52
Using the traditional Tabular layout .....	53
Controlling blank lines, grand totals, and other settings .....	55
Customizing a pivot table's appearance with styles and themes .....	58
Customizing a style .....	59
Modifying styles with document themes .....	61
Changing summary calculations .....	63
The Excel team fixed the Count Of Revenue bug .....	63
Changing the calculation in a value field .....	64

Showing percentage of total . . . . .	67
Using % Of to compare one line to another line . . . . .	67
Showing rank. . . . .	68
Tracking running total and percentage of running total. . . . .	68
Displaying a change from a previous field. . . . .	69
Tracking the percentage of a parent item . . . . .	70
Tracking relative importance with the Index option. . . . .	70
Adding and removing subtotals . . . . .	71
Suppressing subtotals with many row fields . . . . .	71
Adding multiple subtotals for one field . . . . .	72
Formatting one cell is new in Microsoft 365 . . . . .	73
Next Steps . . . . .	75
<b>Chapter 4 Grouping, sorting, and filtering pivot data</b> . . . . .	<b>77</b>
Using the PivotTable Fields pane . . . . .	77
Docking and undocking the PivotTable Fields pane. . . . .	79
Minimizing the PivotTable Fields pane . . . . .	79
Rearranging the PivotTable Fields pane . . . . .	80
Using the Areas section dropdowns . . . . .	81
Sorting in a pivot table. . . . .	81
Sorting customers into high-to-low sequence based on revenue . . . . .	82
Using a manual sort sequence. . . . .	85
Using a custom list for sorting. . . . .	86
Filtering a pivot table: An overview . . . . .	89
Using filters for row and column fields . . . . .	90
Filtering using the checkboxes . . . . .	90
Filtering using the search box . . . . .	92
Filtering using the Label Filters option . . . . .	93
Filtering a Label column using information in a Values column . . . . .	94
Creating a top-five report using the Top 10 filter. . . . .	96
Filtering using the Date filters in the Label dropdown. . . . .	98
Filtering using the Filters area . . . . .	99
Adding fields to the Filters area. . . . .	99
Choosing one item from a filter . . . . .	100

Choosing multiple items from a filter .....	100
Replicating a pivot table report for each item in a filter .....	100
Filtering using slicers and timelines .....	102
Using timelines to filter by date .....	104
Driving multiple pivot tables from one set of slicers .....	105
Grouping and creating hierarchies in a pivot table .....	107
Grouping numeric fields .....	107
Grouping date fields manually .....	111
Including years when grouping by months .....	113
Grouping date fields by week .....	114
Creating an easy year-over-year report .....	115
Creating hierarchies .....	117
Next steps .....	121
<b>Chapter 5 Performing calculations in pivot tables</b> .....	<b>123</b>
Introducing calculated fields and calculated items .....	123
Method 1: Manually add a calculated field to the data source ...	124
Method 2: Use a formula outside a pivot table to create a calculated field .....	125
Method 3: Insert a calculated field directly into a pivot table ....	126
Creating a calculated field .....	127
Creating a calculated item .....	135
Understanding the rules and shortcomings of pivot table calculations.	140
Remembering the order of operator precedence .....	140
Using cell references and named ranges .....	141
Using worksheet functions .....	141
Using constants .....	141
Referencing totals .....	141
Rules specific to calculated fields .....	141
Rules specific to calculated items .....	148
Managing and maintaining pivot table calculations .....	148
Editing and deleting pivot table calculations .....	148
Changing the solve order of calculated items .....	149
Documenting formulas .....	150
Next steps .....	150

<b>Chapter 6</b>	<b>Using pivot charts and other visualizations</b>	<b>151</b>
	What is a pivot chart...really? .....	151
	Creating a pivot chart.....	152
	Understanding pivot field buttons.....	155
	Keeping pivot chart rules in mind.....	156
	Changes in the underlying pivot table affect a pivot chart .....	156
	The placement of data fields in a pivot table might not be best suited for a pivot chart .....	156
	A few formatting limitations still exist in Excel .....	159
	Examining alternatives to using pivot charts .....	163
	Method 1: Turn the pivot table into hard values.....	164
	Method 2: Delete the underlying pivot table .....	164
	Method 3: Distribute a picture of the pivot chart .....	165
	Method 4: Use cells linked back to the pivot table as the source data for the chart.....	165
	Using conditional formatting with pivot tables.....	167
	An example of using conditional formatting .....	168
	Preprogrammed scenarios for condition levels.....	170
	Creating custom conditional formatting rules.....	170
	Next steps .....	176
<b>Chapter 7</b>	<b>Analyzing disparate data sources with pivot tables</b>	<b>177</b>
	Using the Data Model .....	178
	Building out your first Data Model.....	178
	Managing relationships in the Data Model.....	181
	Adding a new table to the Data Model.....	182
	Limitations of the Data Model.....	182
	Building a pivot table using external data sources.....	183
	Building a pivot table with Microsoft Access data.....	183
	Building a pivot table with SQL Server data .....	186
	Leveraging Power Query to extract and transform data.....	189
	Power Query basics.....	190
	Understanding Applied Steps .....	195
	Refreshing Power Query data .....	198

Power Query connection types . . . . .	198
One more Power Query example . . . . .	200
Next steps . . . . .	203
<b>Chapter 8 Sharing dashboards with Power BI</b>	<b>205</b>
Getting started with Power BI Desktop . . . . .	205
Preparing data in Excel . . . . .	206
Importing data to Power BI . . . . .	206
Getting oriented to Power BI . . . . .	207
Preparing data in Power BI . . . . .	209
Defining synonyms in Power BI Desktop . . . . .	211
Building an interactive report with Power BI Desktop . . . . .	211
Building your first visualization . . . . .	211
Building your second visualization . . . . .	215
Cross-filtering charts . . . . .	216
Creating a drill-down hierarchy . . . . .	216
Importing a custom visualization . . . . .	218
Publishing to Power BI . . . . .	220
Designing for the mobile phone . . . . .	220
Publishing to a workspace . . . . .	220
Next steps . . . . .	222
<b>Chapter 9 Using cube formulas with the Data Model or OLAP data</b>	<b>223</b>
Converting your pivot table to cube formulas . . . . .	224
Introduction to OLAP . . . . .	232
Connecting to an OLAP cube . . . . .	233
Understanding the structure of an OLAP cube . . . . .	236
Understanding the limitations of OLAP pivot tables . . . . .	238
Creating an offline cube . . . . .	238
Breaking out of the pivot table mold with cube functions . . . . .	241
Exploring cube functions . . . . .	241
Adding calculations to OLAP pivot tables . . . . .	243
Creating calculated measures . . . . .	244

Creating calculated members .....	247
Managing OLAP calculations .....	250
Performing what-if analysis with OLAP data .....	251
Next steps .....	257
<b>Chapter 10 Unlocking features with the Data Model and Power Pivot</b>	<b>259</b>
Replacing XLOOKUP with the Data Model .....	260
Unlocking hidden features with the Data Model .....	263
Count Distinct in a pivot table .....	264
Including filtered items in totals .....	266
Creating median in a pivot table using DAX measures .....	268
Reporting text in the Values area .....	270
Processing big data with Power Query .....	271
Adding a new column using Power Query .....	273
Power Query is like the Macro Recorder but better .....	275
Avoiding the Excel grid by loading to the Data Model .....	276
Adding a linked table .....	277
Defining a relationship between two tables using Diagram View .....	278
Adding calculated columns in the Power Pivot grid .....	279
Sorting one column by another column .....	280
Creating a pivot table from the Data Model .....	280
Using advanced Power Pivot techniques .....	281
Handling complicated relationships .....	281
Using time intelligence .....	282
Creating a Flattened Pivot Table .....	283
Overcoming limitations of the Data Model .....	284
Enjoying other benefits of Power Pivot .....	286
Create all future pivot tables using the Data Model .....	286
Learning more .....	287
Next steps .....	290

<b>Chapter 11 Analyzing geographic data with 3D Map</b>	<b>291</b>
Analyzing geographic data with 3D Map .....	291
Preparing data for 3D Map .....	292
Geocoding data .....	292
Building a column chart in 3D Map .....	294
Navigating through the map .....	294
Labeling individual points .....	296
Building pie or bubble charts on a map .....	296
Using heat maps and region maps .....	297
Exploring 3D Map settings .....	298
Fine-tuning 3D Map .....	299
Combining two data sets .....	299
Animating data over time .....	300
Building a tour .....	300
Creating a video from 3D Map .....	301
Next steps .....	305
<b>Chapter 12 Enhancing pivot table reports with macros</b>	<b>307</b>
Using macros with pivot table reports .....	307
Recording a macro .....	308
Creating a user interface with form controls .....	311
Altering a recorded macro to add functionality .....	313
Inserting a scrollbar form control .....	314
Creating a macro using Power Query .....	317
Next steps .....	325
<b>Chapter 13 Using VBA or TypeScript to create pivot tables</b>	<b>327</b>
Enabling VBA in your copy of Excel .....	328
Using a file format that enables macros .....	329
Unblock workbooks from the web .....	329
Visual Basic Editor .....	330
Visual Basic tools .....	330
The macro recorder .....	331

Understanding object-oriented code . . . . .	<b>331</b>
Learning tricks of the trade. . . . .	<b>332</b>
Writing code to handle a data range of any size . . . . .	<b>332</b>
Using super-variables: Object variables . . . . .	<b>333</b>
Using With and End With to shorten code. . . . .	<b>334</b>
Understanding versions. . . . .	<b>334</b>
Building a pivot table in Excel VBA. . . . .	<b>335</b>
Adding fields to the data area . . . . .	<b>337</b>
Formatting the pivot table . . . . .	<b>338</b>
Dealing with the limitations of pivot tables. . . . .	<b>340</b>
Filling blank cells in the data area. . . . .	<b>340</b>
Filling blank cells in the row area . . . . .	<b>341</b>
Preventing errors from inserting or deleting cells. . . . .	<b>341</b>
Controlling totals. . . . .	<b>342</b>
Converting a pivot table to values . . . . .	<b>343</b>
Pivot table 201: Creating a report showing revenue by category. . . . .	<b>346</b>
Ensuring that Tabular layout is used . . . . .	<b>348</b>
Rolling daily dates up to years. . . . .	<b>348</b>
Eliminating blank cells . . . . .	<b>350</b>
Controlling the sort order with AutoSort. . . . .	<b>351</b>
Changing the default number format. . . . .	<b>351</b>
Suppressing subtotals for multiple row fields. . . . .	<b>352</b>
Copying a finished pivot table as values to a new workbook . . . . .	<b>353</b>
Handling final formatting . . . . .	<b>354</b>
Adding subtotals to get page breaks. . . . .	<b>354</b>
Putting it all together . . . . .	<b>355</b>
Calculating with a pivot table . . . . .	<b>358</b>
Addressing issues with two or more data fields. . . . .	<b>358</b>
Using calculations other than Sum. . . . .	<b>360</b>
Using calculated data fields . . . . .	<b>362</b>
Using calculated items . . . . .	<b>363</b>
Calculating groups . . . . .	<b>365</b>
Using Show Values As to perform other calculations. . . . .	<b>366</b>
Using advanced pivot table techniques . . . . .	<b>369</b>
Using AutoShow to produce executive overviews. . . . .	<b>369</b>

Using ShowDetail to filter a data set .....	371
Creating reports for each region or model .....	373
Manually filtering two or more items in a pivot field .....	377
Using the conceptual filters .....	378
Using the search filter .....	381
Setting up slicers to filter a pivot table .....	382
Using the Data Model in Excel .....	385
Adding both tables to the Data Model .....	385
Creating a relationship between the two tables .....	386
Defining the pivot cache and building the pivot table .....	387
Adding model fields to the pivot table .....	387
Adding numeric fields to the Values area .....	388
Putting it all together .....	388
Using TypeScript in Excel Online to create pivot tables .....	391
Next steps .....	394
<b>Chapter 14 Advanced pivot table tips and techniques</b> .....	<b>395</b>
Tip 1: Force pivot tables to refresh automatically .....	396
Tip 2: Refresh all pivot tables in a workbook at the same time .....	396
Tip 3: Sort data items in a unique order, not ascending or descending ..	397
Tip 4: Using (or prevent using) a custom list for sorting your pivot table .....	398
Tip 5: Use pivot table defaults to change the behavior of all future pivot tables .....	400
Tip 6: Turn pivot tables into hard data .....	400
Tip 7: Fill the empty cells left by row fields .....	401
Option 1: Implement the Repeat All Item Labels feature .....	402
Option 2: Use Excel's Go To Special functionality .....	403
Tip 8: Add a rank number field to a pivot table .....	404
Tip 9: Reduce the size of pivot table reports .....	406
Delete the source data worksheet .....	406
Tip 10: Create an automatically expanding data range .....	406
Tip 11: Compare tables using a pivot table .....	407
Tip 12: AutoFilter a pivot table .....	409

Tip 13: Force two number formats in a pivot table .....	412
Tip 14: Format individual values in a pivot table .....	413
Tip 15: Format sections of a pivot table.....	415
Tip 16: Create a frequency distribution with a pivot table.....	417
Tip 17: Use a pivot table to explode a data set to different tabs .....	419
Tip 18: Apply restrictions on pivot tables and pivot fields.....	420
Pivot table restrictions .....	420
Pivot field restrictions.....	422
Tip 19: Use a pivot table to explode a data set to different workbooks .	424
Tip 20: Use percentage change from previous for year-over-year .....	426
Tip 21: Do a two-way VLOOKUP with Power Query .....	428
Tip 22: Create a slicer to control data from two different data sets.....	434
Tip 23: Format your slicers .....	437
Next steps .....	439

## **Chapter 15 Dr. Jekyll and Mr. GetPivotData 441**

Avoiding the aggravating GetPivotData problem.....	442
Preventing GetPivotData by typing the formula .....	445
Simply turning off GetPivotData.....	445
Speculating on why Microsoft forced GetPivotData on us.....	446
Using GetPivotData to solve pivot table annoyances.....	447
Building an ugly pivot table .....	449
Building the shell report .....	452
Using GetPivotData to populate the shell report.....	454
Updating the report in future months .....	457
Next steps .....	458

## **Chapter 16 Creating pivot tables in Excel Online 459**

How to sign in to Excel Online.....	460
Creating a pivot table in Excel Online .....	462
Changing pivot table options in Excel Online.....	465
Where are the rest of the features? .....	469
Next steps .....	470

<b>Chapter 17</b>	<b>Pivoting without a pivot table using formulas, Python, or Power Query</b>	<b>471</b>
	Creating cross-tabs using GROUPBY or PIVOTBY functions.....	471
	The GROUPBY syntax.....	472
	Creating a simple summary with GROUPBY.....	472
	Sorting the results of GROUPBY and PIVOTBY.....	474
	Moving totals to the top of the report.....	474
	Showing subtotals for multiple row fields using GROUPBY.....	475
	Moving from GROUPBY to PIVOTBY functions.....	476
	What are the pros and cons of GROUPBY and PIVOTBY?.....	477
	Creating a cross-tab using Power Query.....	477
	Getting your data into Power Query.....	478
	Summarizing Revenue by Sector and Region in Power Query....	478
	Sorting and pivoting in Power Query.....	479
	Cleaning final steps.....	481
	What are the pros and cons of Power Query?.....	482
	Creating a cross-tab using Python in Excel.....	482
	Getting your data into a Python data frame.....	483
	Using the Python pivot_table function.....	484
	Grouping dates in Python pivot tables.....	487
	Pros and cons of Python.....	489
	Next steps.....	489
<b>Chapter 18</b>	<b>Using Artificial Intelligence and Copilot for building pivot tables</b>	<b>491</b>
	Using AI to add a column to your data before pivoting.....	492
	Install and configure the Excel Labs add-in.....	492
	Creating a prompt using a formula.....	494
	Prevent multiple calculations of each formula.....	495
	Use the LABS.GENERATIVEAI function to retrieve answers.....	495
	Using Analyze Data to find trends and ask questions.....	497
	Asking questions to Analyze Data.....	503
	Using Copilot in Excel to create pivot tables or pivot charts.....	506
	Using Copilot in Excel to generate formula columns.....	512

Using Copilot in Excel for highlighting, sorting, or filtering . . . . .	516
Using Advanced Copilot in Excel with Python . . . . .	518
Join data from two tables and create a pivot table. . . . .	519
Create a word cloud from text. . . . .	521
Create a basketball shot chart in Excel . . . . .	524
Perform sentiment analysis from text. . . . .	525
Solve the knapsack problem . . . . .	527
Overall impressions of Copilot in Excel. . . . .	528
Using Copilot in OneDrive to analyze financial statements in Excel . . . . .	529
Using AI to find and summarize Excel YouTube videos . . . . .	532
Using Copilot to write VBA, Python, RegEx, or Power Query M Code . . . . .	534
Generating a pivot table using VBA from Copilot. . . . .	534
Generating a pivot table using Python Code generated by Copilot. . . . .	536
Generating Power Query M code using Copilot . . . . .	537
Generating RegEx with Copilot. . . . .	538
Fun: Using Copilot to write Excel poetry or songs. . . . .	539
Next steps . . . . .	542
<b>Chapter 19 Unpivoting in Power Query</b> . . . . .	<b>543</b>
Data in headings creates bad pivot tables. . . . .	543
Using Unpivot in Power Query to transform the data . . . . .	545
Unpivoting from two rows of headings . . . . .	548
Unpivoting from a delimited cell to new rows . . . . .	555
Conclusion . . . . .	557
<i>Afterword</i> . . . . .	559
<i>Index</i> . . . . .	561

# Acknowledgments

At Microsoft, thanks to the Excel team for always being willing to answer questions about various features. At MrExcel.com, thanks to an entire community of people who are passionate about Excel. Thanks to Bob Umlas for his tech editing of this book and to the Kughens for their project management. Thanks to Mike Alexander for being my co-author on this book through the first four editions. Thanks to Suat Ozgur—the Batcoder—for his review of my code in Chapter 13. Finally, thanks to my wife, Mary Ellen, for her support during the writing process.

# About the author

**Bill Jelen**, Excel MVP and the host of MrExcel.com, has been using spreadsheets since 1985, and he launched the MrExcel.com website in 1998. Bill was a regular guest on *Call for Help* with Leo Laporte and has produced more than 2,600 episodes of his daily video podcast, Learn Excel from MrExcel. He is the author of 69 books about Microsoft Excel and writes the monthly Excel column for *Strategic Finance* magazine. Before founding MrExcel.com, Bill spent 12 years in the trenches, working as a financial analyst for the finance, marketing, accounting, and operations departments of a \$500 million public company. He lives in Merritt Island, Florida, with his wife, Mary Ellen.

# Introduction

The pivot table is the single most powerful tool in all of Excel. Pivot tables came along during the 1990s, when Microsoft and Lotus were locked in a bitter battle for dominance of the spreadsheet market. The race to continually add enhanced features to their respective products during the mid-1990s led to many incredible features, but none as powerful as the pivot table.

With a pivot table, you can transform one million rows of transactional data into a summary report in seconds. If you can drag a mouse, you can create a pivot table. In addition to quickly summarizing and calculating data, pivot tables enable you to change your analysis on the fly by simply moving fields from one area of a report to another.

No other tool in Excel gives you the flexibility and analytical power of a pivot table. The Power Query tools that debuted between Excel 2013 and Excel 2016 come close to the power of a pivot table. You will see some Power Query examples in Chapter 17, “Pivoting without a pivot table using formulas, Python, or Power Query,” and Chapter 18, “Unpivoting in Power Query.”

## What you will learn from this book

---

It is widely agreed that close to 60 percent of Excel customers leave 80 percent of Excel untouched—that is, most people do not tap into the full potential of Excel’s built-in utilities. Of these utilities, the most prolific by far is the pivot table. Despite the fact that pivot tables have been a cornerstone of Excel for almost 30 years, they remain one of the most underused tools in the entire Microsoft Office suite.

Having picked up this book, you are savvy enough to have heard of pivot tables—and you have perhaps even received them on occasion. You have a sense that pivot tables provide a power that you are not using, and you want to learn how to leverage that power to increase your productivity quickly.

Within the first two chapters, you will be able to create basic pivot tables, increase your productivity, and produce reports in minutes instead of hours. Within the first seven chapters, you will be able to output complex pivot reports with drill-down capabilities and accompanying charts. By the end of the book, you will be able to build a dynamic pivot table reporting system.

## What is new in Microsoft Excel's pivot tables

---

Microsoft introduced two new array functions to make it easier to replicate a pivot table using a formula: PIVOTBY and GROUPBY. One advantage of formulas over pivot tables is that formulas will automatically recalculate when the underlying data changes. There are times when you are creating dashboards for the manager three levels up, and you really can't count on them to know to click the Refresh button on the pivot table menu. In these cases, the PIVOTBY function can make sure your dashboard is up to date.

For several years, Microsoft offered the Analyze Data feature where you could often create a pivot table just by asking a question about your data. The Analyze Data feature is tested and reliable and will always produce a reliable result. For this edition of the book, a brand new Copilot feature is available in Excel. You have to pay extra. It will often produce a report as accurate as the same report as Analyze Data. However, it will sometimes produce the wrong report or an inaccurate report. At the very least, having Copilot on the other side of a paywall should make you appreciate the superior Analyze Data feature that is freely available in Microsoft 365.

You can now create a pivot table while using Excel Online. It does not offer all the features of Excel for Windows, but being able to create a pivot table in Excel Online is a giant leap for the online version of Excel. It was just few years ago that I wrote in the previous edition of this book that Excel Online would never allow you to create pivot tables, and now, they do it. You can't tweak them like you can in Windows, but you can create pivot tables.

Office 365 offers a new Analyze Data feature that is powered by Artificial Intelligence. Select a data set with up to 250,000 cells and ask Excel to analyze the data. Excel will suggest about 30 interesting analyses, including several pivot tables.

The Analyze Data feature allows you to ask a question about your data. There is a fairly high chance that the answer will be provided as a pivot table or a pivot chart. So, Analyze Data and Ask a Question become new entry points for creating pivot tables.

If you missed the 2019 edition of this book, these features were new since Excel 2016:

- You can specify default settings for all future pivot tables.
- The automatic date grouping introduced in Excel 2016 pivot tables can now be turned off. A mix of empty cells and numeric cells will be treated like a numeric column and will default to Sum instead of Count.
- Power Pivot is now included in all Windows versions of Excel 2019 and Office 365.

## Case study: Life without pivot tables

Say that your manager asks you to create a one-page summary of a sales database. They would like to see total revenue by region and product. Suppose you do not know how to use pivot tables. You will have to use dozens of keystrokes or mouse clicks to complete this task.

This sample data set (included with the download files for the book—see page xxxii)—has headings in row 1, data in rows 2 through 564, and columns in column A through column I.

First, you have to get a sorted, unique list of products down the left side of the summary report and a sorted, unique list of products across the top. In the past, this might involve an Advanced Filter or the Remove Duplicates command. But today, it is easiest with a formula.

1. Enter `=SORT(UNIQUE(B2:B564))` in cell K2. You will have a list of the unique region names spilling to K2:K5.
2. To get a list of unique products across the top of the report, enter `=TRANSPOSE(SORT(UNIQUE(C2:C564)))` in cell L1.

At this point, with 57 keystrokes, you've built the shell of the final report, but there are no numbers inside yet (see Figure I-1).

	B	C	D	E	F	G	H	I	J	K	L	M	N	O
1	Region	Product	Date	Customer	Quantity	Revenue	COGS	Profit			Doodads	Gadget	Gizmo	Widget
2	Midwest	Gizmo	1/1/2029	Ford	1000	22810	10220	12590		Midwest				
3	Northeast	Gadget	1/2/2029	Verizon	100	2257	984	1273		Northeast				
4	South	Gizmo	1/4/2029	Valero Energy	400	9152	4088	5064		South				
5	Midwest	Gadget	1/4/2029	Cardinal Hea	800	18552	7872	10680		West				

**FIGURE I-1** It took 57 keystrokes to get to this point.

Next, you need to build a SUMIFS function to total the revenue for each Region and Product. As shown in Figure I-2, the formula `=SUMIFS(G2:G564,B2:B564,K2#,C2:C564,L1#)` does the trick. It takes 40 characters plus the Enter key to finish the formula.

	K	L	M	N	O
		Doodads	Gadget	Gizmo	Widget
Midwest		6036	544772	652651	597965
Northeast		38860	714009	751724	620019
South		0	839551	918588	844186
West		28663	65382	70057	75349

**FIGURE I-2** Before Dynamic Arrays were introduced, the formula in L2 would have needed dollar signs and then been copied to all 16 cells showing numbers.

Enter the heading Total for the total row and for the total column. You can do this in nine keystrokes if you type the first heading, press Ctrl+Enter to stay in the same cell, and then use Copy, select the cell for the second heading, and use Paste.

If you select K1:P6 and press Alt+= (that is, Alt and the equal sign key), you can add the total formula in three keystrokes.

With this method, which takes 110 clicks or keystrokes, you end up with a nice summary report, as shown in Figure I-3. If you could pull this off in 5 or 10 minutes, you would probably be fairly proud of your Excel prowess; there are some good tricks among those 110 operations.

K	L	M	N	O	P
	Gizmo	Gadget	Widget	Doodads	Total
Midwest	652651	544772	537965	6036	1741424
Northeast	751724	714009	620019	38860	2124612
South	918588	839551	844186	0	2602325
West	70057	65382	75349	28663	239451
Total	2393020	2163714	2077519	73559	6707812

**FIGURE I-3** A mere 110 operations later, you have a summary report.

You hand the report to your manager. Within a few minutes, they come back with one of the following requests, which will certainly cause a lot of rework:

- Could you put products down the side and regions across the top?
- Could you show me the same report for only the manufacturing customers?
- Could you show profit instead of revenue?
- Could you copy this report for each of the customers?

## Invention of the pivot table

---

When the actual pivot table was invented is in dispute. The Excel team coined the term *pivot table*, which appeared in Excel in 1993. However, the concept was not new. Pito Salas and his team at Lotus were working on the pivot table concept in 1986 and released Lotus Improv in 1991. Before then, Javelin offered functionality similar to that of pivot tables.

The core concept behind a pivot table is that the data, formulas, and data views are stored separately. Each column has a name, and you can group and rearrange the data by dragging field names to various positions on the report.

## Case study: Life after pivot tables

Say that you're tired of working so hard to remake reports every time your manager wants a change. You're in luck: You can produce the same report as in the last case study but use a pivot table instead. Excel offers you 10 thumbnails of recommended pivot tables to get you close to the goal. Follow these steps:

1. Click the Insert tab of the ribbon.
2. Click Recommended PivotTables. Scroll through the list of suggested pivot tables, looking for one with Revenue, Product, and Region. You might have to click See All 10 Results below the fourth suggestion. As shown in Figure I-4, you could choose either Revenue By Region And Product or Revenue By Product And Region. Either one is fine. Choose the + Existing Sheet button beneath Revenue By Region And Product.
3. Excel will ask you to specify a starting cell for the pivot table. It is a good idea to leave a blank column to the right of your data and then have the pivot table start in cell K2. The initial pivot table will have both Region and Product in the first column of the pivot table. Your goal is to have the products appear along the top of the pivot table.
4. Drag the Product field from the Rows area to the Columns area (see Figure I-5).

Recommended PivotTables

'Revenue' by 'Region' and 'Product'

Row Labels	Sum of Revenue
Midwest	1741424
Gizmo	652651
Gadget	544772
...	...
Northeast	2124612
...	...

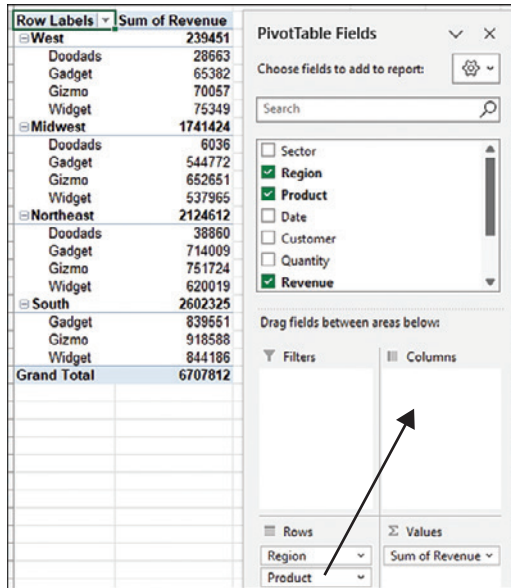

Insert on: + New sheet + Existing sheet

'Revenue' by 'Product' and 'Region'

Row Labels	Sum of Revenue
Doodads	73559
Northeast	38860
West	28663
...	...
Gadget	2163714
...	...

Insert on: + New sheet + Existing sheet

**FIGURE I-4** Choose a recommended pivot table that is as close as you will get to the desired report.

**FIGURE I-5** To finish the report, drag the Product heading to the Columns area.

With just a few clicks of the mouse, you have the report shown in Figure I-6.

	Sum of Revenue	Product				
Region	Doodads	Gadget	Gizmo	Widget	Grand Total	
West	28663	65382	70057	75349	239451	
Midwest	6036	544772	652651	537965	1741424	
Northeast	38860	714009	751724	620019	2124612	
South	0	839551	918588	844186	2602325	
<b>Grand Total</b>	<b>73559</b>	<b>2163714</b>	<b>2393020</b>	<b>2077519</b>	<b>6707812</b>	

**FIGURE I-6** It took a few clicks to create this report.

In addition, when your manager comes back with a request like the ones near the end of the prior case study, you can easily use the pivot table to make the changes. Here's a quick overview of the changes you'll learn to make in the chapters that follow:

- Could you put products down the side and regions across the top? (This change will take you 10 seconds: Drag Product to Rows and Region to Columns.)
- Could you show me the same report for only the manufacturing customers? (15 seconds: Select Insert Slicer | Sector. Then, click OK and click Manufacturing.)
- Could you show profit instead of revenue? (10 seconds: Clear the Revenue checkbox and select the Profit checkbox.)

- Could you copy this report for each of the customers? (30 seconds: Move Customer to Report Filter, open the tiny dropdown next to the Options button, choose Show Report Filter Pages, and click OK. For more details, see Tip 17: Use a pivot table to explode a data set to different tabs in Chapter 14).

## Creating a pivot table using Artificial Intelligence

The new Analyze Data tool uses artificial intelligence to analyze a data set. You can type a question in natural language, and Excel will create a pivot table.

With one cell in your data set selected, choose the Analyze Data command on the right side of the Home tab. The Analyze Data pane appears with several suggested analyses. In the Ask a Question box at the top, type **Revenue by Product and Region as Table** and press Enter.

Excel will draw a thumbnail of your report. Click +Insert PivotTable at the bottom of the thumbnail.

Analyze Data

< Revenue by region and product as table

Revenue by region and product as table

Here's our answer  
Showing total 'Revenue' by 'Region' and 'Product' as a table.

'Revenue' by 'Region' and 'Product'				
Sum of Revenue	Product			
Region	Doodads	Gadget	Gizmo	W...
South		839551	...	...
Northeast	38860	714009	...	...
Midwest	6036	544772	...	...
West	20663	65302	70057	...
...	...	...	...	...

+ Insert PivotTable    Is this helpful?

Not what you meant? Try:

- > 'Region', 'Product', and individual 'Revenue'
- > Average 'Revenue' by 'Region' and 'Product'

**FIGURE I-7** Slightly more typing, but certainly easier to create.

## Who this book is for

---

This book is a comprehensive-enough reference for hard-core analysts yet relevant to casual users of Excel.

We assume that you are comfortable navigating in Excel and that you have some large data sets that you need to summarize.

## How this book is organized

---

The bulk of the book covers how to use pivot tables in the Excel user interface. Chapter 10, “Unlocking features with the Data Model and Power Pivot,” delves into the Power Pivot window. Chapter 13, “Using VBA or TypeScript to create pivot tables,” describes how to create pivot tables in Excel’s powerful VBA macro language. Chapter 18, “Using Artificial Intelligence and Copilot for Building Pivot Tables,” describes using artificial intelligence and Copilot to create analyses. Anyone who has a firm grasp of basics such as preparing data, copying, pasting, and entering simple formulas should not have a problem understanding the concepts in this book.

## About the companion content

---

The download files for this book include all of the data sets used to produce the book, so you can practice the concepts in the book. For access to these companion files, and other resources, visit [MicrosoftPressStore.com/register](https://MicrosoftPressStore.com/register), sign in or create a new account, and register ISBN 9780135408797 by December 31, 2027.

## System requirements

---

You need the following software and hardware to build and run the code samples for this book:

You will need Microsoft Excel running on a Windows computer. (Yes, Excel runs on an iPad, on an Android tablet, but none of those are going to support the creation of pivot tables anytime soon.) For people using Excel on a Mac, some of the basic pivot table concepts will apply. Power Query and Power Pivot will not run on a Mac. For people using Excel Online, you can make many of the pivot tables in this book, but you won’t be able to do as much formatting.

## Compact versus tabular layout

Microsoft changed the default layout of pivot tables in 2007 to something that it calls Compact layout. For various reasons that I will explain here, I am not a fan of Compact layout and have changed settings in Excel options so that my pivot tables are created in Tabular layout. As you work through this book, it will help if you can quickly recognize the contrast between how Compact and Tabular layouts show the same data.

In Figure I-8, columns N:Q show a traditional pivot table in tabular layout. Each of the three row fields appears in a different column with meaningful headings such as Region, Product, and Sector.

In contrast, columns S:T show the same data in compact layout. The meaningful headings from N2:P2 are replaced by a single heading of “Row Labels” in S2. The values for Region, Product, and Sector are intermingled in column S with a different indent level showing if you are looking at a region, product name, or sector name.

	N	O	P	Q	R	S	T
2	Region	Product	Sector	Sum of Revenue		Row Labels	Sum of Revenue
3	West	Widget	Energy	26406		West	239451
4	West	Widget	Financial	13853		Widget	75349
5	West	Widget	Manufacturing	17840		Energy	26406
6	West	Widget	Retail	17250		Financial	13853
7	West	Widget Total		75349		Manufacturing	17840
8	West	Gizmo	Energy	7032		Retail	17250
9	West	Gizmo	Financial	19544		Gizmo	70057
10	West	Gizmo	Manufacturing	25861		Energy	7032
11	West	Gizmo	Retail	17620		Financial	19544
12	West	Gizmo Total		70057		Manufacturing	25861
13	West	Gadget	Energy	20610		Retail	17620
14	West	Gadget	Financial	26484		Gadget	65382
15	West	Gadget	Healthcare	2358		Energy	20610
16	West	Gadget	Manufacturing	11550		Financial	26484
17	West	Gadget	Retail	4380		Healthcare	2358
18	West	Gadget Total		65382		Manufacturing	11550
19	West	Doodads	Healthcare	28663		Retail	4380
20	West	Doodads Total		28663		Doodads	28663
21	West Total			239451		Healthcare	28663
22	Midwest	Gizmo	Consumer Goods	61125		Midwest	1741424
23	Midwest	Gizmo	Healthcare	17728		Gizmo	652651

**FIGURE I-8** The Row Labels heading in S2 is the clue that your pivot tables are defaulting to Compact layout.

My irritation with the Compact layout is how Excel mixes Regions, Products, and Sectors in column S. Any human reading the report can tell the difference by noticing the indent levels. But there is no calculation function that can tell the difference between a field indented by eight spaces instead of four spaces.

I know that in many cases, I will be converting the pivot table to values and using the static version of the table for other uses. Those other uses will always need each field in its own column.

If you are following along with the examples in this book and end up with a pivot table in Compact layout, rest assured that the numbers in your pivot table and the numbers in the book are the same, just with different formatting.

You can switch one pivot table to a new layout using the Design tab in the ribbon. Open the Report Layout dropdown and choose between Compact and Tabular.

If you happen to agree that the pivot table shown in columns N:Q of Figure I-8 is superior to the pivot table shown in columns S:T, then follow these steps to change your pivot table defaults on your computer.

1. Open the File menu and choose Excel Options.
2. In the Excel Options dialog, choose the Data category from the left navigation bar.
3. Click the top button for Edit Default Layout next to Make Changes To The Default Layout Of Pivot Tables.
4. Open the Report Layout dropdown and choose Show in Tabular Form.
5. Choose the box next to Repeat All Item Labels.
6. Click the PivotTable Options... button in the lower-right part of the Edit Default Layout dialog. There are five tabs across the top of the PivotTable Options dialog.
7. On the Layout & Format tab, click in the For Empty Cells Show box and type a zero (0). Click OK three times to close all of the open dialogs.

Your pivot tables will now default to the format shown on the left side of Figure I.8.

## Errata, updates, and book support

---

We've made every effort to ensure the accuracy of this book and its companion content. You can access updates to this book—in the form of a list of submitted errata and their related corrections—at the following page:

*[MicrosoftPressStore.com/Excel365pivotdata/errata](http://MicrosoftPressStore.com/Excel365pivotdata/errata)*

If you discover an error that is not already listed, please submit it to us at the same page.

For additional book support and information, please visit:

*[MicrosoftPressStore.com/Support](http://MicrosoftPressStore.com/Support)*

Please note that product support for Microsoft software and hardware is not offered through the previous addresses. For help with Microsoft software or hardware, go to <http://support.microsoft.com>.

# Creating a basic pivot table

**In this chapter, you will:**

- Format your source data before creating a pivot table
- Learn how to create a basic pivot table
- Understand the Recommended PivotTable and the Analyze Data features
- Use slicers to filter your report
- Keep up with changes in the data source
- Share the pivot cache
- Save time with PivotTable tools

When you have a family portrait taken, the photographer takes time to make sure that the lighting is right, the poses are natural, and everyone smiles their best smile. This preparation ensures that the resulting photo is effective in its purpose.

When you create a pivot table report, you're the photographer, taking a snapshot of your data. By taking time to make sure your data looks its best, you can ensure that your pivot table report is effective in accomplishing the task at hand.

One of the benefits of working in a spreadsheet is that you have the flexibility of laying out your data to suit your needs. Indeed, the layout you choose depends heavily on the task at hand. However, many of the data layouts used for presentations are not appropriate when used as the source data for a pivot table report.

**Tip** As you read the following pages, which discuss preparing your data, keep in mind that pivot tables have only one hard rule pertaining to the data source: The data source must have column headings, which are labels in the first row of the data that describe the information in each column. Without column headings, you cannot create a pivot table report.

However, just because a pivot table report is created successfully does not mean that it's effective. A host of things can go wrong as a result of bad data preparation—from inaccurate reporting to problems with grouping and sorting.

# Format your source data before creating a pivot table

Let's look at a few of the steps you can take to ensure that you end up with a viable pivot table report.

## Ensuring that data is in a Tabular layout

A perfect layout for the source data in a pivot table is a Tabular layout. In Tabular layout, there are no blank rows or columns. Every column has a heading. Every field has a value in every row in most cases. Columns do not contain repeating groups of data.

Figure 2-1 shows an example of data structured properly for a pivot table. There are headings for each column. Even though the values in D2:D6 are all the same model, the model number appears in each cell. Month data is organized down the page instead of across the columns.

	A	B	C	D	E	F
1	REGION	MARKET	STORE	MODEL	MONTH	REVENUE
2	North	Great Lakes	65061011	4055T	April	\$2,354
3	North	Great Lakes	65061011	4055T	February	\$3,040
4	North	Great Lakes	65061011	4055T	January	\$3,454
5	North	Great Lakes	65061011	4055T	March	\$2,675
6	North	Great Lakes	65061011	4055T	May	\$2,071
7	North	New England	2105015	2500P	April	\$11,851
8	North	New England	2105015	2500P	February	\$15,304
9	North	New England	2105015	2500P	January	\$17,391
10	North	New England	2105015	2500P	March	\$13,468
11	North	New England	2105015	2500P	May	\$10,429
12	North	New England	22022012	3002C	April	\$256
13	North	New England	22022012	3002C	February	\$330
14	North	New England	22022012	3002C	January	\$375
15	North	New England	22022012	3002C	March	\$300

**FIGURE 2-1** This data is structured properly for use as a pivot table source.

Tabular layouts are *database-centric*, meaning you would most commonly find these types of layouts in databases. These layouts are designed to store and maintain large amounts of data in a well-structured, scalable format.

**Tip** You might work for a manager who demands that the column labels be split into two rows. For example, they might want the heading Gross Margin to be split, with Gross in row 1 and Margin in row 2. Because pivot tables require a unique heading one row high, your manager's preference can be problematic. To overcome this problem, start typing your heading; for example, type **Gross**. Before leaving the cell, press Alt+Enter and then type **Margin**. The result is a single cell that contains two lines of data.

## Avoiding storing data in section headings

Examine the data in Figure 2-2. This spreadsheet shows a report of sales by month and a model for the North region of a company. Because the data in rows 2 through 24 pertains to the North region, the author of the worksheet entered the title North as a single cell in C1. This approach is effective for displaying the data, but it's not effective for a pivot table data source.

Also, in Figure 2-2, the author was very creative with the model information. The data in rows 2 through 6 applies to Model 2500P, so the author entered this value once in A2 and then applied a fancy vertical format combined with Merge Cells to create an interesting look for the report. Again, although this is a cool format, it is not useful for pivot table reporting.

	A	B	C
1			North
2	Model 2500P	January	33,073
3		February	35,880
4		March	90,258
5		April	13,250
6		May	100,197
8	Model 3002P	January	29,104
9		February	31,574
10		March	79,427
11		April	11,660
12		May	88,173
14	Model 4055T	January	35,880
15		February	25,612
16		March	27,785
17		April	69,896
18		May	10,261
20	Model 4500T	January	33,073
21		February	25,612
22		March	27,785
23		April	69,896
24		May	10,261

**FIGURE 2-2** Region and model data are not formatted properly in this data set.

In addition, the worksheet in Figure 2-2 is missing column headings. You can guess that column A is Model, column B is Month, and column C is Sales. However, for Excel to create a pivot table, this information must be included in the first row of the data.

## Avoiding repeating groups as columns

The format shown in Figure 2-3 is common. A time dimension is presented across several columns. Although it is possible to create a pivot table from this data, this format is not ideal.

	A	B	C	D	E	F	G	H
1								
2	North	MODEL	JANUARY	FEBRUARY	MARCH	APRIL	MAY	JUNE
3		4054T	\$2,789	\$2,454	\$2,160	\$1,901	\$1,673	\$1,472
4		4500C	\$32,605	\$28,692	\$25,249	\$22,219	\$19,553	\$17,207
5		3002P	\$52,437	\$46,145	\$40,607	\$35,734	\$31,446	\$27,673
6		2500P	\$17,391	\$15,304	\$13,468	\$11,851	\$10,429	\$9,178
7		4055T	\$2,468	\$2,172	\$1,911	\$1,682	\$1,480	\$1,302
8		3002C	\$375	\$330	\$290	\$256	\$225	\$198

**FIGURE 2-3** This matrix format is common but not effective for pivot tables. The Month field is spread across several columns of the report.

The problem is that the headings spread across the top of the table pull double duty as column labels and actual data values. In a pivot table, this format would force you to manage and maintain six fields, each representing a different month.

## Eliminating gaps and blank cells in the data source

Delete all empty columns within your data source. An empty column in the middle of your data source causes your pivot table to fail on creation because the blank column, in most cases, does not have a column name.

Delete all empty rows within your data source. Empty rows may cause you to inadvertently leave out a large portion of your data range, making your pivot table report incomplete.

Fill in as many blank cells in your data source as possible. Although filling in cells is not required to create a workable pivot table, blank cells are generally errors waiting to happen. A good practice is to represent missing values with some logical missing value code wherever possible.

**Note** Although eliminating gaps and blank cells might seem like a step backward for those of you who are trying to create a nicely formatted report, it pays off in the end. When you are able to create a pivot table, there will be plenty of opportunities to apply some pleasant formatting.

**Note** In Chapter 3, “Customizing a pivot table,” you’ll discover how to apply style formatting to your pivot tables.

## Applying appropriate type formatting to fields

Formatting fields appropriately helps you avoid a whole host of possible issues, from inaccurate reporting to problems with grouping and sorting.

Make certain that any fields to be used in calculations are explicitly formatted as a number, currency, or any other format appropriate for use in mathematical functions. Fields containing dates should also be formatted as any one of the available date formats.

## Summary of good data source design

The attributes of an effective tabular design are as follows:

- The first row of your data source is made up of field labels or headings that describe the information in each column.
- Each column in your data source represents a unique category of data.

- Each row in your data source represents individual items in each column.
- None of the column names in your data source double as data items that will be used as filters or query criteria (that is, names of months, dates, years, names of locations, or names of employees).

## Case study: Cleaning up data for pivot table analysis

The worksheet shown in Figure 2-4 is a great-looking report. However, it cannot be effectively used as a data source for a pivot table. Can you identify the problems with this data set?

	A	B	C	D	E	F
1	Sector	Customer		Jan	Feb	Mar
2	Associations	IMA Houston Chapter		0	0	0
3		Association for Computers & Taxation		30094	0	0
4						
5	Consultants	Andrew Spain Consulting		89581	114596	112012
6		Data2Impact		21730	0	0
7		Cambia Factor		0	0	0
8		Fintega Financial Modelling		21015	0	0
9		Excelerator BI		0	0	0
10		Construction Intelligence & Analytics, Inc.		22104	0	2484
11						
12	Professional	Serving Brevard Realty		0	7152	24224
13		WM Squared Inc.		0	0	0
14		Juliet Babcock-Hyde CPA, PLLC		0	0	0
15						
16	Retail	Hartville MarketPlace and Flea Market		34132	40608	12427

**FIGURE 2-4** Someone spent a lot of time formatting this report to look good, but what problems prevent it from being used as a data source for a pivot table?

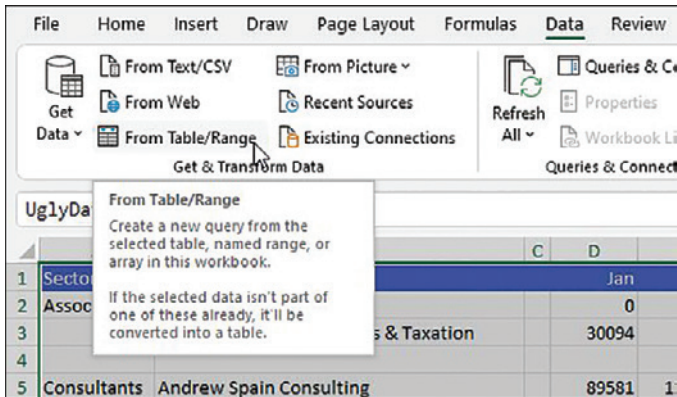

These are the three problems with the data set and the fixes needed to get the data set pivot table ready:

- There are blank rows and columns in the data. Column C should be deleted. The blank rows between sectors (such as rows 4, 11, and 15) also should be deleted.
- Blank cells present the data in an outline format. The person reading this worksheet would probably assume that cells A6:A10 fall into the Consultants sector. These blank cells need to be filled in with the values from above.
- The worksheet presents the data for each month in several columns (one column per month). Columns D through O need to be reformatted as two columns. Place the month name in one column and the units for that month in the next column.

Cleaning this data used to require some VBA code or a bunch of manual steps in Excel. The Get & Transform tools that debuted in Excel 2016 will make it very easy to clean this data. Follow these steps:

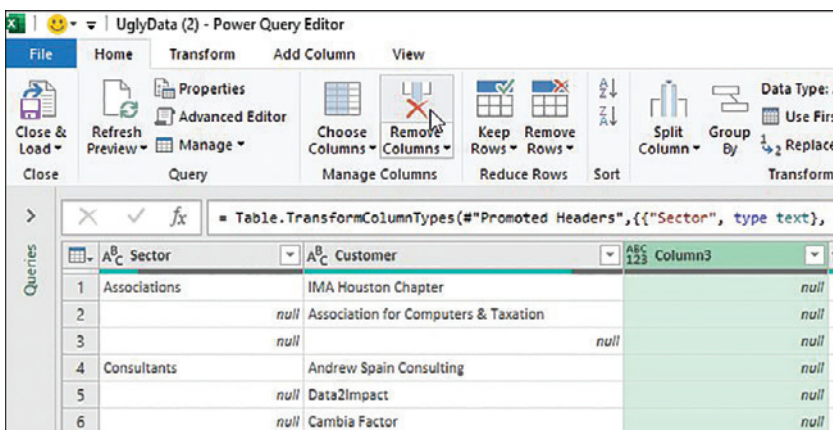

1. Select the entire range of data. In the sample file, it would be A1:O33.
2. Click in the Name box and type a one-word name, such as **UglyData**. Press Enter to name the range.
3. On the Data tab, in the Get & Transform Data group, choose From Table/Range (see Figure 2-5).

**FIGURE 2-5** Originally called Power Query but later rebranded as Get & Transform Data, these new tools that appeared on the Data tab in 2016 are amazing.

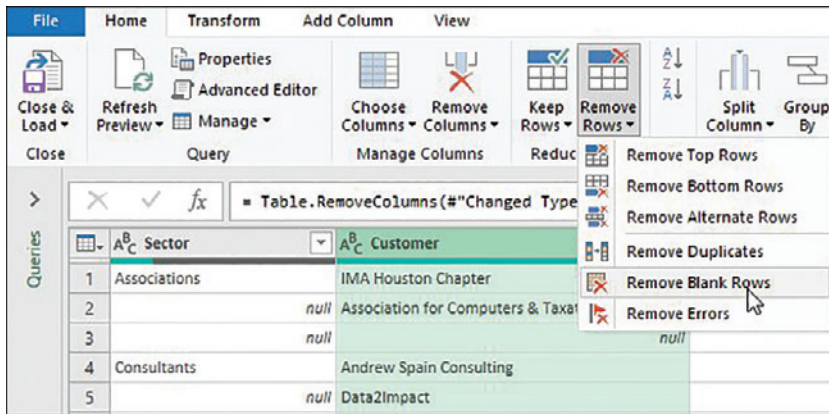

The Power Query Editor will open. Notice you have ribbon tabs for Home, Transform, Add Column, and View. Follow these steps in the Power Query Editor.

4. The formerly blank column C now has a heading of Column 3. Click that heading and choose Remove Columns from the Home tab (see Figure 2-6).

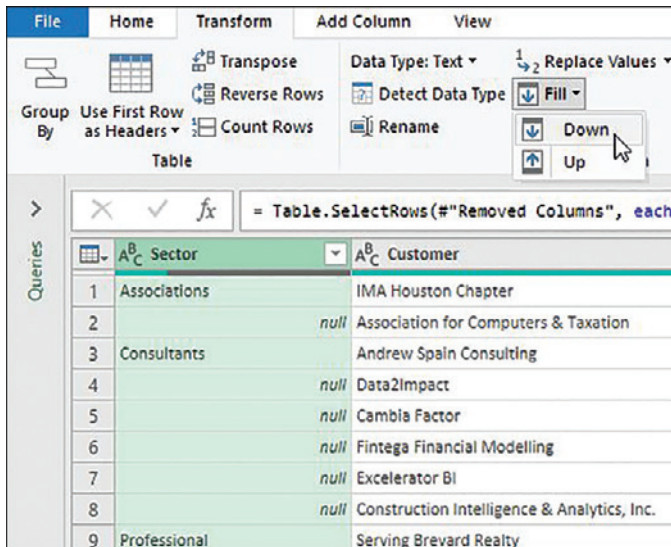

**FIGURE 2-6** The Power Query Editor offers tools that are often better than their Excel equivalents.

- Click the Customer heading. Choose Home | Remove Rows | Remove Blank Rows (see Figure 2-7).

**FIGURE 2-7** Deleting blank rows is a built-in command in Power Query.

- Select the Sector column header. From the Transform tab, choose Fill | Down (see Figure 2-8). This amazing command will replace all the null cells with the value from above.

**FIGURE 2-8** Fill Down replaces Home | Find & Select | Go To Special | Blanks | OK, and then entering =A2 and pressing Ctrl+Enter. It is far easier to remember one command instead of many obscure commands strung together.

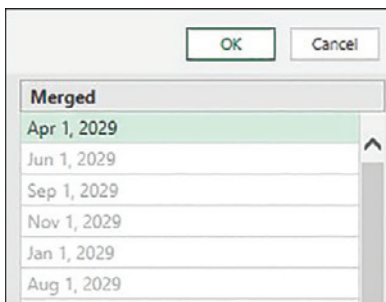

- Select both the Sector and Customer headings.
- Open the Unpivot Columns dropdown on the Transform tab and choose Unpivot Other Columns. The result is shown in Figure 2-9. Pause for a moment to admire the sheer

simplicity of steps 5 through 8. Those are three new tools that replace far more complicated tasks in Excel. Although the data could be returned to Excel at this point, there are a few simple clean-up steps left.

	Sector	Customer	Attribute	Value
1	Associations	IMA Houston Chapter	Jan	0
2	Associations	IMA Houston Chapter	Feb	0
3	Associations	IMA Houston Chapter	Mar	0
4	Associations	IMA Houston Chapter	Apr	14004
5	Associations	IMA Houston Chapter	May	0
6	Associations	IMA Houston Chapter	Jun	4060
7	Associations	IMA Houston Chapter	Jul	0
8	Associations	IMA Houston Chapter	Aug	0
9	Associations	IMA Houston Chapter	Sep	18072
10	Associations	IMA Houston Chapter	Oct	0
11	Associations	IMA Houston Chapter	Nov	15104
12	Associations	IMA Houston Chapter	Dec	0
13	Associations	Association for Computers & Taxation	Jan	30094
14	Associations	Association for Computers & Taxation	Feb	0

**FIGURE 2-9** At this point, you could return the data to Excel for pivoting.

9. Right-click the Value column. Choose Rename and type **Revenue**.
10. Open the Filter dropdown for Revenue. Unselect 0 to remove all the zero values.
11. Select the Attribute Column. On the Add Column tab, choose Column From Example. The first row in your data might read “Apr.” If this data applies to the year 2029, type a value of **Apr 1, 2029** in the new column. Power Query fills in the remaining rows and offers a Merged heading. Click OK (see Figure 2-10).

**FIGURE 2-10** Add Column From Example is similar to Flash Fill in Excel, but it actually creates a formula that can be reused.

12. Right-click the heading for the new Merged column. Choose Rename and type **Date** as the heading name.

13. With the Date column selected, click the Transform tab. Open the Date Type dropdown and choose Date. The text dates are converted to real dates.
14. You no longer need the month abbreviations shown in the Attribute column. Choose the Attribute column and then Home | Remove Columns. Before you return to Excel, look at the right side of the Power Query window for the list of Applied Steps. This is the world's greatest Undo stack. You can click any step and see what the data looked like at that point. If you made a mistake several steps ago, you can click that step and make a correction. If you want to be more impressed, select the View tab and choose Advanced Editor. All that code is a programming language called "M." By doing steps 4 through 13, you successfully wrote a program that can be reused the next time you download similar data from the IT department.
15. Select Home | Close | Load. Your original data stays on Sheet1, and a new Sheet2 is added to the workbook (see Figure 2-11). The cleaned data is narrow and tall. In general, narrow and tall data sets are better for pivoting.

	A	B	C	D
1	Sector	Customer	Revenue	Date
2	Associations	IMA Houston Chapter	24004	4/1/2029
3	Associations	IMA Houston Chapter	4060	6/1/2029
4	Associations	IMA Houston Chapter	18072	9/1/2029
5	Associations	IMA Houston Chapter	15104	11/1/2029
6	Associations	Association for Computers & Taxation	30094	1/1/2029
7	Associations	Association for Computers & Taxation	4270	8/1/2029
8	Consultants	Andrew Spain Consulting	89581	1/1/2029
9	Consultants	Andrew Spain Consulting	114596	2/1/2029
10	Consultants	Andrew Spain Consulting	112012	3/1/2029
11	Consultants	Andrew Spain Consulting	67408	4/1/2029
12	Consultants	Andrew Spain Consulting	84383	5/1/2029

**FIGURE 2-11** Just 11 steps in Power Query quickly cleaned the ugly data.

Not only is Power Query fast, it makes it easy to redo the data cleansing. Go back to Sheet1 and change any number in the original data. Go to Sheet2. Expand the Queries & Connections panel so you can click the Refresh icon on the far right of the UglyData query. Power Query repeats all the steps and updates the result.

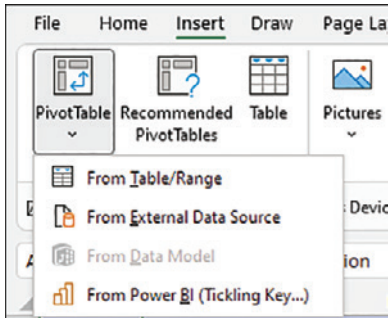

## How to create a basic pivot table

Now that you have a good understanding of the importance of a well-structured data source, let's walk through creating a basic pivot table.

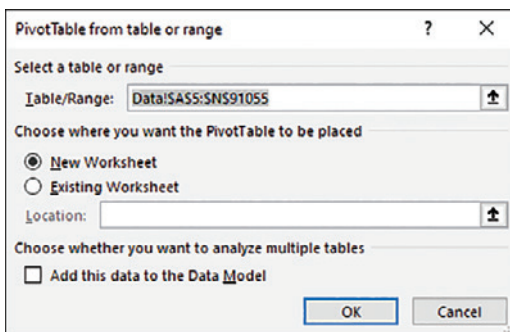

**Note** The sample data set used throughout this book is available for download at [www.microsoftpressstore.com/ExcelPivotTable/downloads](http://www.microsoftpressstore.com/ExcelPivotTable/downloads).

To ensure that the pivot table captures the range of your data source by default, click any single cell in your data source. Next, select the Insert tab and find the Tables group. In the Tables group, select PivotTable and then choose From Table/Range from the dropdown. Figure 2-12 demonstrates how to start a pivot table.

**FIGURE 2-12** Start a pivot table by selecting PivotTable from the Insert tab.

Choosing these options activates the Create PivotTable dialog, shown in Figure 2-13.

**FIGURE 2-13** The Create PivotTable dialog.

**Tip** You can also press the shortcut to start a pivot table: Press and release Alt, press and release N, and then press and release V.

As you can see in Figure 2-13, the Create PivotTable dialog asks you only two fundamental questions:

- Where's the data that you want to analyze?
- Where do you want to put the pivot table?

Here's how you handle these two sections of the dialog:

- **Choose The Data That You Want To Analyze**—In this section, you tell Excel where your data set is. You can specify a data set that is located within your workbook, or you can tell Excel to

look for an external data set. As you can see in Figure 2-13, Excel is smart enough to read your data set and fill in the range for you. However, you should always take note of the range Excel selects to ensure that you are capturing all your data.

- **Choose Where You Want The PivotTable Report To Be Placed**—In this section, you tell Excel where you want your pivot table to be placed. This is set to New Worksheet by default, meaning that your pivot table will be placed in a new worksheet within the current workbook. You will rarely change this setting because there are relatively few times you'll need your pivot table to be placed in a specific location.

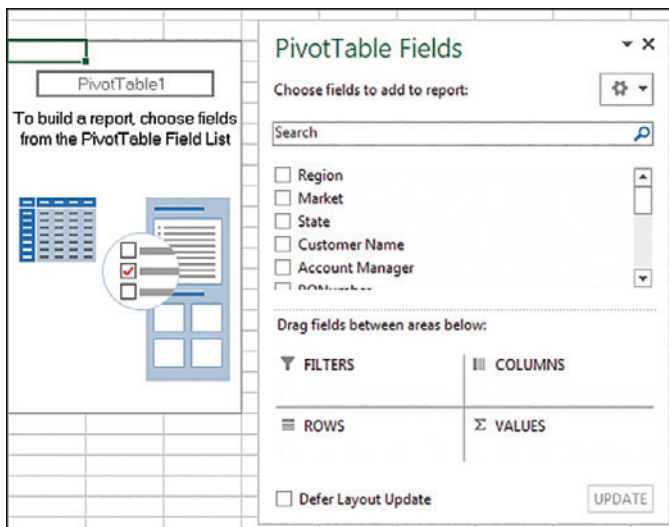

**Note** Note the presence of another option in the Create PivotTable dialog shown in Figure 2-13: the Add This Data To The Data Model option. You would select this option if you were trying to consolidate multiple data sources into a single pivot table.

The Add This Data To The Data Model option is covered in detail in Chapter 7, “Analyzing disparate data sources with pivot tables,” and in Chapter 10, “Unlocking features with the Data Model and Power Pivot.”

In this chapter, we'll keep it basic by covering the steps to create a pivot table by using a single source, which means you can ignore this particular option.

After you have answered the two questions in the Create PivotTable dialog, simply click the OK button. At this point, Excel adds a new worksheet that contains an empty pivot table report. Next to that is the PivotTable Fields list, shown in Figure 2-14. This pane helps you build your pivot table.

**FIGURE 2-14** You use the PivotTable Fields list to build a pivot table.

**Caution** The icons for Columns and Rows in Figure 2-14 are reversed. A summer intern at Microsoft inadvertently reversed the icons several versions ago, and no one noticed. After Bill pointed this out to the correct project manager, Microsoft pledged to restore the icons to the correct location. The dark-gray portion of the icon is supposed to show where the data will be displayed when you drop a field here. Any data dropped into the Columns area will display across the top of the report (as illustrated in the icon currently in the Rows area). It feels sort of goofy to show the wrong icons in this book on pivot tables, but that's the way it appears to us at press time.

**Tip Finding the PivotTable Fields list**

The PivotTable Fields list is your main work area in Excel. This is the place where you add fields and make changes to a pivot table report. By default, this pane pops up when you place your cursor anywhere inside a pivot table. However, if you explicitly close this pane, you override the default and essentially tell the pane not to activate when you are in the pivot table.

If clicking on the pivot table does not activate the PivotTable Fields list, you can manually activate it by right-clicking anywhere inside the pivot table and selecting Show Field list. You can also click anywhere inside the pivot table and then choose the large Fields List icon on the Analyze tab under PivotTable Tools in the ribbon.

## Adding fields to a report

You can add the fields you need to a pivot table by using the four “areas” found in the PivotTable Fields list: Filters, Columns, Rows, and Values. These areas, which correspond to the four areas of the pivot table, are used to populate your pivot table with data:

- **Filters**—Adding a field to the Filters area enables you to filter on its unique data items. In previous versions of Excel, this area was known as the Report Filters area.
- **Columns**—Adding a field into the Columns area displays the unique values from that field across the top of the pivot table.
- **Rows**—Adding a field into the Rows area displays the unique values from that field down the left side of the pivot table.
- **Values**—Adding a field into the Values area includes that field in the Values area of your pivot table, allowing you to perform a specified calculation using the values in the field.

**Note** Review Chapter 1, “Pivot table fundamentals,” for a refresher on the four areas of a pivot table.

## Fundamentals of laying out a pivot table report

Now, let's pause a moment and go over some fundamentals of laying out a pivot table report. This is generally the point where most new Excel customers get stuck. How do you know which field goes where?

Before you start dropping fields into the various areas, answer two questions:

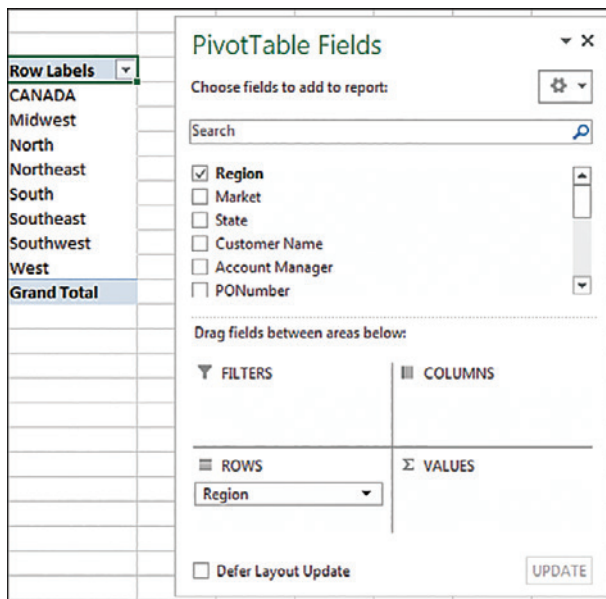

- "What am I measuring?"
- "How do I want to see it?"

The answer to the first question tells you which fields in your data source you need to work with, and the answer to the second question tells you where to place the fields.

Let's say you wanted to measure the dollar sales by region. This would automatically tell you that you need to work with the Sale Amount and Region fields. How do you want to see it? You want regions to go down the left side of the report and the sales amount to be calculated next to each region.

To achieve this effect, you need to add the Region field to the Rows area and add the Sale Amount field to the Values area.

Find the Region field in the PivotTable Fields list and select the checkbox next to it. As you can see in Figure 2-15, not only is the field automatically added to the Rows area, but also your pivot table is updated to show the unique region names.

**FIGURE 2-15** Select the checkbox next to the Region field to automatically add that field to your pivot table.

**Tip** If you see a region that is repeated in the Rows area, it usually means that there are one or more trailing spaces after some of the rows for that region. You should find those cells, delete the trailing spaces, and then Refresh the pivot table.

Now that you have regions in your pivot table, it's time to add in the dollar sales. To do that, simply find the Sale Amount field and select the checkbox next to it. As Figure 2-16 shows, the Sale Amount field is automatically added to the Values area, and your pivot table report now shows the total dollar sales for each region.

Row Labels	Sum of Sale Amount
CANADA	3748101.15
Midwest	7232896.2
North	2377761.45
Northeast	7639710
South	101671133.8
Southeast	21599862.2
Southwest	8441594.5
West	11853624
<b>Grand Total</b>	<b>164564683.3</b>

**PivotTable Fields**

Choose fields to add to report:

Search

Product Name

Quantity

Sale Amount

Equipment Cost

MORE TABLES...

Drag fields between areas below:

**FILTERS**

**ROWS**  
Region

**COLUMNS**

**VALUES**  
Sum of Sale Amount

Defer Layout Update

UPDATE

**FIGURE 2-16** Select the checkbox next to the Sale Amount field to add data to your pivot table report.

At this point, you have already created your first pivot table report!

### **Tip** How does Excel know where your fields go?

As you've just experienced, the PivotTable Fields list interface enables you to add fields to your pivot table by simply selecting the checkbox next to each field name. Excel automatically adds the selected fields to the pivot table. But how does Excel know which area to use for a field you select? The answer is that Excel doesn't really know which area to use, but it makes a decision based on data type. Here's how it works: When you select a checkbox next to a field, Excel evaluates the data type for that field. If the data type is numeric, Excel places the field in the Values area; otherwise, Excel places the field in the Rows area. This placement obviously underlines the importance of correctly assigning the data types for your fields.

**Note** Blank cells in your numeric columns previously caused the column to be treated as text. A change in early 2018 for Office 365 subscribers changed this behavior. Now, a column with a mix of numbers and empty cells will be treated as values, and the field will go to the Values area with a default calculation of Sum.

If you have someone who clears out cells by mashing down the spacebar several times instead of using the Delete key, Excel will treat those spaces as text. A mix of numbers and text in a column will cause Excel to default to counting the column instead of summing.

## Adding layers to a pivot table

Now, you can add another layer of analysis to your report. Say that now you want to measure the amount of dollar sales each region earned by product category. Because your pivot table already contains the Region and Sales Amount fields, all you have to do is select the checkbox next to the Product Category field. As you can see in Figure 2-17, your pivot table automatically added a layer for the Product Category and refreshed the calculations to include subtotals for each region. Because the data is stored efficiently in the pivot cache, this change took less than a second.

Row Labels	Sum of Sale Amount
<b>CANADA</b>	<b>3748101.15</b>
Bar Equipment	35975.25
Commercial Appliances	71272.1
Concession Equipment	205874.6
Fryers	129636.2
Ovens and Ranges	1183772.75

<b>ROWS</b>	<b>VALUES</b>
Region	Sum of Sale Amount
Product Category	

Defer Layout Update UPDATE

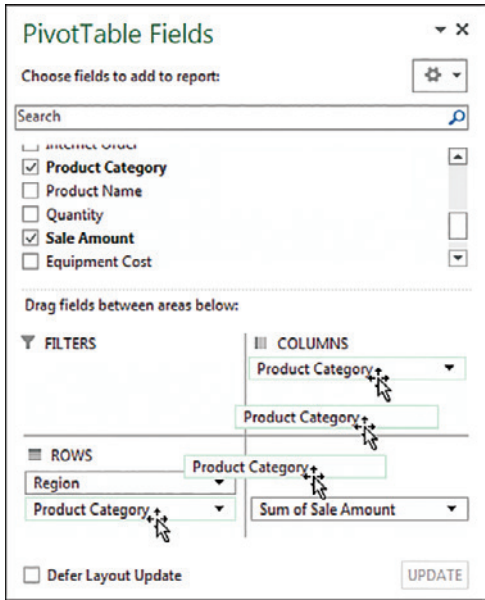

**FIGURE 2-17** Without pivot tables, adding layers to analyses requires hours of work and complex formulas.

## Rearranging a pivot table

Suppose that the view you've created doesn't work for your manager. He wants to see Product Categories across the top of the pivot table report. To make this change, simply drag the Product Category field from the Rows area to the Columns area, as illustrated in Figure 2-18.

**Note** You don't have to move your fields into an area to be able to drag them around. You can actually drag fields directly from the list of fields in the PivotTable Fields list to the desired area. You can also move a field into an area by using that field's context menu: Click the black triangle next to the field name and then select the desired area.

**FIGURE 2-18** Rearranging a pivot table is as simple as dragging fields from one area to another.

The report is instantly restructured, as shown in Figure 2-19.

Sum of Sale Amount	Column Labels			
Row Labels	Bar Equipment	Commercial Appliances	Concession Equipment	Fryers
CANADA	35975.25	71272.1	205874.6	129636.2
Midwest	63713	199187.5	197173.7	164789
North	20184.9	43965.15	102245	69059.25
Northeast	68407.1	285103.35	258557.4	190152.4

Southwest	73528.5	289526.5	355845.45	268554.85
West	68684.65	296291.55	422201.2	276443.05
<b>Grand Total</b>	<b>1806137.9</b>	<b>8634337.05</b>	<b>10083748.4</b>	<b>3971959.1</b>

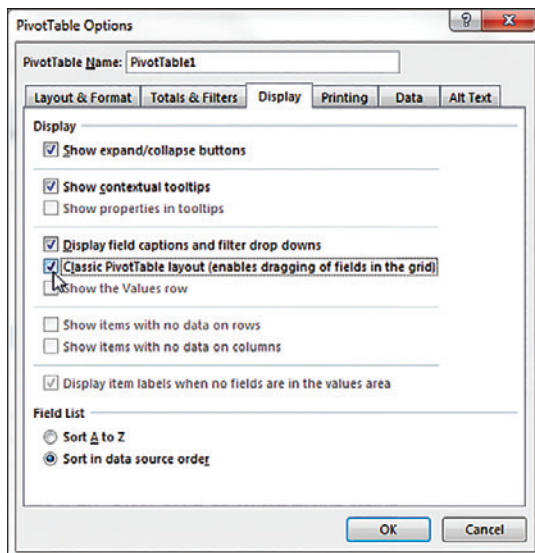

**FIGURE 2-19** Your product categories are now column-oriented.

### Tip Longing for drag-and-drop functionality?

In Excel 2003 and previous versions, you could drag and drop fields directly onto the pivot table layout. This functionality is allowed only within the PivotTable Fields list (dragging into areas). However, Microsoft has provided the option of working with a classic pivot table layout, which enables drag-and-drop functionality.

To activate the classic pivot table layout, right-click anywhere inside the pivot table and select PivotTable Options. In the PivotTable Options dialog, select the Display tab and select the checkbox next to Classic PivotTable Layout, as demonstrated in Figure 2-20. Click the OK button to apply the change.

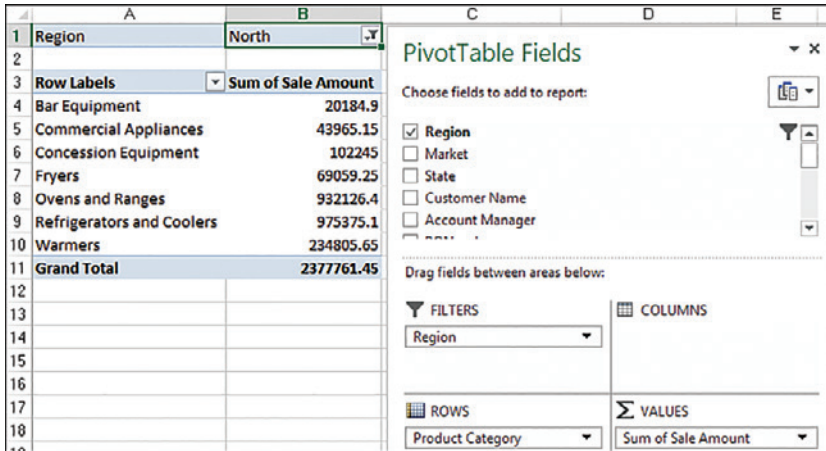

**FIGURE 2-20** Select the checkbox next to Classic PivotTable Layout.

At this point, you can drag and drop fields directly onto your pivot table layout. If you always want your pivot tables to be in Classic layout, follow these steps:

1. Select File | Options. A new Data category is added along the left panel starting in 2017 for Microsoft 365 subscribers.
2. In the Data category, the first setting is Make Changes To The Default Layout Of Pivot-Tables. Click Edit Default Layout.
3. The Edit Default Layout dialog offers a few common choices. Apparently, Classic layout did not make it to the top few choices. Click the PivotTable Options button in the Edit Default Layout dialog. You will see a dialog similar to Figure 2-20. Choose the Display tab and the Classic PivotTable Layout. Click OK three times to close each of the open dialogs. All future pivot tables can be built in Classic mode.

## Creating a report filter

You might be asked to produce different reports for particular regions, markets, or products. Instead of building separate pivot table reports for every possible analysis scenario, you can use the Filter field to create a report filter. For example, you can create a region-filtered report by simply dragging the Region field to the Filters area and the Product Category field to the Rows area. This way, you can analyze one particular region at a time. Figure 2-21 shows the totals for just the North region.

Region	Sum of Sale Amount
Bar Equipment	20184.9
Commercial Appliances	43965.15
Concession Equipment	102245
Fryers	69059.25
Ovens and Ranges	932126.4
Refrigerators and Coolers	975375.1
Warmers	234805.65
<b>Grand Total</b>	<b>2377761.45</b>

**FIGURE 2-21** With this setup, you not only can see revenues by product clearly, but also can click the Region dropdown to focus on one region.

## Understanding the Analyze Data, Copilot, and Recommended PivotTable features

As this book is being written in the summer of 2024, the Artificial Intelligence industry is moving at the speed of sound. At this point, Copilot is still in preview and will be coming out to General Availability later in 2024.

At this moment, the Analyze Data feature is the mature option for creating pivot tables and pivot charts using Artificial Intelligence. In 2024, Microsoft changed the legacy Recommended PivotTable functionality to use the same algorithm as the Analyze Data. Looking forward, the ability for Copilot to create a pivot table has been trained using the existing Analyze Data feature.

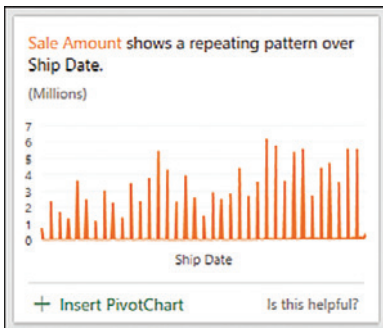

### Tip Analyze Data feature uses artificial intelligence

The Analyze Data feature uses artificial intelligence to analyze up to 250,000 cells of your data. It offers descriptive pivot tables and then offers far more advanced analyses. The Analyze Data feature often produces over 30 choices. Figures 2-22 and 2-23 show some results available from it.

**FIGURE 2-22** Artificial Intelligence detected a pair of outliers in this segment of the data.

**FIGURE 2-23** Ideas detected a repeating pattern. This might indicate some weekly or monthly seasonality.

Unfortunately, customers who purchased a perpetual license to Excel 2021 or Excel 2024 will not have the feature in either location. Microsoft's stance is that if you are not continuing to pay a monthly subscription fee, you cannot make use of the Office intelligent services.

In late 2019, a second iteration of artificial intelligence was added that allows you to ask a natural-language question about your data. See Figure 7 in the Introduction for an example.

# Using slicers to filter your report

With Excel 2010, Microsoft introduced a feature called *slicers*. Slicers enable you to filter your pivot table in much the same way as Filter fields filter a pivot table. The difference is that slicers offer a user-friendly interface that enables you to easily see the current filter state, even when multiple items are selected.

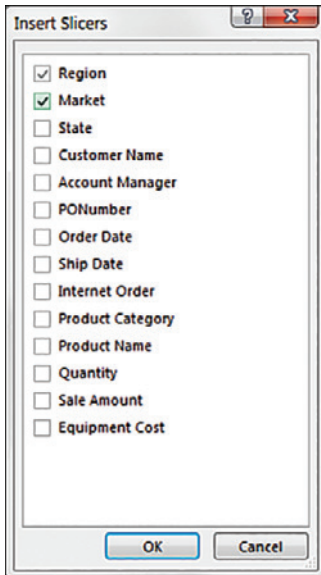

## Creating a standard slicer

To understand the concept behind slicers, place your cursor anywhere inside your pivot table and then select the Insert tab on the ribbon. Click the Slicer icon (see Figure 2-24).

**FIGURE 2-24** Inserting a slicer.

The Insert Slicers dialog, shown in Figure 2-25, opens. The idea is to select the dimensions you want to filter. In this example, the Region and Market slicers are selected.

**FIGURE 2-25** Select the dimensions for which you want to create slicers.

After the slicers are created, you can simply click the filter values to filter your pivot table. As you can see in Figure 2-26, clicking Midwest in the Region slicer filters your pivot table, and also the Market slicer responds by highlighting the markets that belong to the Midwest region.

	A	B	C	D
1				
2	Sum of Sale Amount	Column Labels		
3	Row Labels	Bar Equipment	Commercial Appliances	Concession Equip
4	Chicago	3168	9081	
5	Kansas City	41891.9	61404.15	5
6	Omaha	7896.8	76213.6	7
7	Tulsa	10756.3	52488.75	4
8	Grand Total	63713	199187.5	19

**Region**

- Canada
- Midwest
- North
- Northeast
- South
- Southeast
- Southwest

**Market**

- Chicago
- Kansas City
- Omaha
- Tulsa
- Baltimore
- Buffalo
- California

**FIGURE 2-26** Select the dimensions you want to filter using slicers.

**Tip** You can select multiple values by holding down the Ctrl key on your keyboard while selecting the needed filters. Alternatively, you can enable the Multi-Select toggle next to the filter icon at the top of the slicer.

In Figure 2-27, the Multi-Select toggle was enabled and then Baltimore, California, Charlotte, and Chicago were selected. Note that Excel highlights the selected markets in the Market slicer and also highlights their associated regions in the Region slicer.

Another advantage you gain with slicers is that you can tie each slicer to more than one pivot table. In other words, any filter you apply to your slicer can be applied to multiple pivot tables.

To connect a slicer to more than one pivot table, simply right-click the slicer and select Report Connections. The Report Connections dialog, shown in Figure 2-28, opens. Select the checkbox next to any pivot table that you want to filter using the current slicer.

At this point, any filter applied via the slicer is applied to all the connected pivot tables. Again, slicers have a unique advantage over Filter fields in that they can control the filter state of multiple pivot tables. Filter fields can control only the pivot table in which they live.

Note that the choices in Figure 2-28 are the pivot tables that rely on the same pivot table cache. If you want to use a slicer to control data coming from two different data sets, see “Tip 22 – Slicer to control data from two different data sets” in Chapter 14.

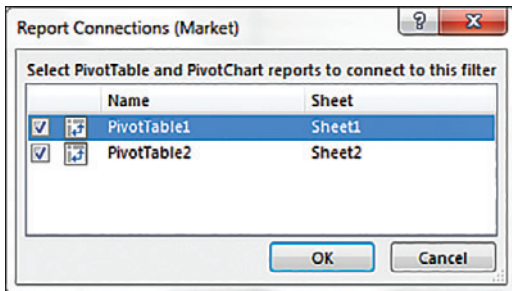

The Multi-Select Toggle

Sum of Sale Amount	Column Labels				
Row Labels	Bar Equipment	Commercial Appliances	Concession Equipment	Fryers

**FIGURE 2-27** The fact that they enable you to see the current filter state gives slicers a unique advantage over the Filter field.

**FIGURE 2-28** Choose the pivot tables you want to filter using this slicer.

**Tip** Notice that in Figure 2-28, the list of pivot tables is a bit ambiguous (PivotTable1, PivotTable2). Excel automatically gives your pivot tables these generic names, which it uses to identify them. You can imagine how difficult it would be to know which pivot table is which when working with more than a handful of pivots. Therefore, you might want to consider giving your pivot tables user-friendly names so you can recognize them in dialogs, such as the one you see in Figure 2-28.

You can easily change the name of a pivot table by placing your cursor anywhere inside the pivot table, selecting the PivotTable Analyze tab, and entering a friendly name in the PivotTable Name input box found on the far left.

## Creating a Timeline slicer

The Timeline slicer (introduced with Excel 2013) works in the same way as a standard slicer in that it lets you filter a pivot table using a visual selection mechanism instead of the old Filter fields. The difference is that the Timeline slicer is designed to work exclusively with date fields, and it provides an excellent visual method to filter and group the dates in a pivot table.

**Note** In order to create a Timeline slicer, your pivot table must contain a field where *all* the data is formatted as dates. This means that your source data table must contain at least one column where all the values are formatted as valid dates. If even only one value in the source date column is blank or not a valid date, Excel does not create a Timeline slicer.

To create a Timeline slicer, place your cursor anywhere inside your pivot table, select the Insert tab on the ribbon, and then click the Timeline icon.

The Insert Timelines dialog opens, showing you all the available date fields in the chosen pivot table. Here, you select the date fields for which you want to create slicers.

After your Timeline slicer is created, you can filter the data in your pivot table by using this dynamic data-selection mechanism. As you can see in Figure 2-29, clicking the April slicer filters the data in the pivot table to show only April data.

Row Labels	Sum of Sale Amount	Ship Date
Buffalo	42638	Apr 2007
California	102981	2006 2007
CANADA	32459	DEC JAN FEB MAR APR MAY JUN
Charlotte	373468.3	
Chicago	4637	
Dakotas	9274	
Dallas	47749.4	

**FIGURE 2-29** Click a date selection to filter your pivot table.

Figure 2-30 demonstrates how you can expand the slicer range with the mouse to include a wider range of dates in your filtered numbers.

Row Labels	Sum of Sale Amount	Ship Date
Buffalo	335113	Feb - Apr 2007
California	543023	2006 2007
CANADA	147187.7	DEC JAN FEB MAR APR MAY JUN
Charlotte	1178225.2	
Chicago	6878	
Dakotas	27353.8	
Dallas	469309.15	
Denver	281211	

**FIGURE 2-30** You can expand the range on the Timeline slicer to include more data in the filtered numbers.

Want to quickly filter your pivot table by quarters? Well, you can easily do it with a Timeline slicer. Click the time period dropdown and select Quarters. As you can see in Figure 2-31, you also can select Years, Months, or Days, if needed.

Row Labels	Sum of Sale Amount	Ship Date
Buffalo	255644	Q2 2007
California	514395	
CANADA	204463.5	
Charlotte	1211517.5	
Chicago	28492	
Dakotas	65062	
Dallas	695590.45	

**FIGURE 2-31** Quickly switch between filtering by years, quarters, months, and days.

**Note** Be aware that Timeline slicers are not backward compatible with Excel 2010 or earlier.

## Case study: Analyzing activity by market

Your organization has 18 markets that sell 7 types of products. You have been asked to build a report that breaks out each market and highlights the dollar sales for each product. You are starting with an intimidating transaction table that contains more than 91,000 rows of data. To start your report, do the following:

1. Place your cursor inside the data set, select the Insert tab, and click PivotTable.
2. When the Create PivotTable dialog appears, click the OK button. At this point, you should see an empty pivot table with the PivotTable Fields list.
3. Find the Market field in the PivotTable Fields list and select the checkbox next to it.
4. Find the Sale Amount field in the PivotTable Fields list and select the checkbox next to it.
5. To get the product breakouts, find the Product Category field in the PivotTable Fields list and drag it into the Columns area.

In five easy steps, you have calculated and designed a report that satisfies the requirements. After a little formatting, your pivot table report should look similar to the one shown in Figure 2-32.

Lest you lose sight of the analytical power you just harnessed, keep in mind that your data source has more than 91,000 rows and 14 columns, which is a hefty set of data by Excel standards. Despite the amount of data, you produced a relatively robust analysis in a matter of minutes.

Sum of Sale Amount	Column Labels			
Row Labels	Bar Equipment	Commercial Appliances	Concession Equipment	Frye
Baltimore	80			
Buffalo	37397.9	237297.85	187711	127
California	66356.65	294155.55	416379.2	2610
CANADA	35975.25	71272.1	205874.6	128
Charlotte	283682.15	1525742.3	1569948.6	4508
Chicago	3168	9081	18218	9
Dakotas	3386.5	7287.05	30619.2	180
Dallas	59580.3	255146	306037	152
Denver	34558.85	70068.8	75712.8	1200
Florida	1132162.05	5667950.6	6665865.45	2268
Great Lakes	16798.4	36678.1	71625.8	52
Kansas City	41891.9	61404.15	57300.7	50
Knoxville	330	153		

**FIGURE 2-32** This summary can be created in less than a minute.

## Keeping up with changes in the data source

Let's go back to the family portrait analogy. As years go by, your family will change in appearance and might even grow to include some new members. The family portrait that was taken years ago remains static and no longer represents the family today. So, another portrait needs to be taken.

As time goes by, your data might change and grow with newly added rows and columns. However, the pivot cache that feeds your pivot table report is disconnected from your data source, so it cannot represent any of the changes you make to your data source until you take another snapshot.

The action of updating your pivot cache by taking another snapshot of your data source is called *refreshing* your data. There are two reasons you might have to refresh your pivot table report:

- Changes have been made to your existing data source.
- Your data source's range has been expanded with the addition of rows or columns.

The following sections explain how to keep your pivot table synchronized with the changes in your data source.

### Dealing with changes made to the existing data source

If a few cells in your pivot table's source data have changed due to edits or updates, you can refresh your pivot table report with a few clicks. Simply right-click inside your pivot table report and select Refresh. This selection takes another snapshot of your data set, overwriting your previous pivot cache with the latest data.

**Note** You can also refresh the data in a pivot table by selecting the Refresh icon on the PivotTable Analyze tab or Refresh All on the Data tab.

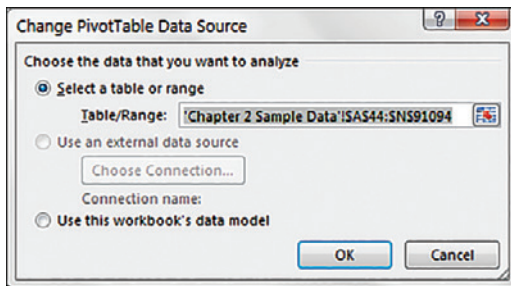

**Tip** Clicking anywhere inside a pivot table activates the PivotTable tabs in the ribbon.

## Dealing with an expanded data source range due to the addition of rows or columns

When changes have been made to your data source that affect its range (for example, if you've added rows or columns), you have to update the range being captured by the pivot cache.

To do this, click anywhere inside the pivot table and then select the PivotTable Analyze tab in the ribbon. From here, select Change Data Source. This selection triggers the dialog shown in Figure 2-33.

**FIGURE 2-33** The Change PivotTable Data Source dialog enables you to redefine the source data for your pivot table.

All you have to do here is update the range to include new rows and columns. After you have specified the appropriate range, click the OK button.

Note that if you format your pivot table source data as a table by choosing Home | Format As Table; Insert | Table; or pressing Ctrl+T, the Pivot Table Source range will automatically expand as the data grows. You will still have to click Refresh to pick up the new rows.

## Sharing the pivot cache or creating a new cache

You quite often need to analyze the same data set in multiple ways. In most cases, this process requires you to create separate pivot tables from the same data source. Keep in mind that every time you create a pivot table, you are storing a snapshot of the entire data set in a pivot cache. Every pivot cache that is created increases your memory usage and file size. For this reason, you should consider sharing your pivot cache.

**Note** In situations where you need to create multiple pivot tables from the same data source, you can use the same pivot cache to feed multiple pivot tables. By using the same pivot cache for multiple pivot tables, you gain a certain level of efficiency when it comes to memory usage and file size.

In legacy versions of Excel, when you created a pivot table using a data set that was already being used in another pivot table, Excel actually gave you the option of using the same pivot cache. However, Excel today does not give you such an option.

Instead, each time you create a new pivot table in Excel, Excel automatically shares the pivot cache. Most of the time, this is beneficial: You can link as many pivot tables as you want to the same pivot cache with a negligible increase in memory and file size.

On the flip side, when you group one pivot table by month and year, all the pivot tables are grouped similarly. If you want one pivot table by month and another pivot table by week, you have to force a separate pivot cache. You can force Excel to create a separate pivot cache by taking the following steps:

1. Select one cell in your original data set.
2. Press and release Alt+D, and then press P to launch the PivotTable Wizard.
3. Click the Next button to get past the first screen of the wizard.
4. On the second screen, select the range for your pivot table and click the Next button.
5. Excel displays a wordy message saying that you can use less memory if you click Yes. Instead, click No.
6. On the next screen, click the Finish button.

At this point, you have a blank pivot table that pulls from its own pivot cache.

**Tip** If you already have an existing pivot table, you can use an alternative method for creating a separate pivot cache: Copy and paste the existing table to a new workbook and then copy and paste the pivot table back to a new sheet in the original workbook.

## Side effects of sharing a pivot cache

It's important to note that there are a few side effects to sharing a pivot cache. For example, suppose you have two pivot tables using the same pivot cache. Certain actions affect both pivot tables, each of which is discussed further in Chapter 5, "Performing calculations in pivot tables":

- **Refreshing your data**—You cannot refresh one pivot table and not the other. Refreshing affects both tables.
- **Adding a calculated field**—If you create a calculated field in one pivot table, your newly created calculated field shows up in the PivotTable Fields list of the other pivot table.
- **Adding a calculated item**—If you create a calculated item in one pivot table, it shows in the other as well.

- **Grouping or ungrouping fields**—Any grouping or ungrouping you perform affects both pivot tables. For instance, suppose you group a date field in one pivot table to show months. The same date field in the other pivot table is also grouped to show months.

Although none of these side effects are critical flaws in the concept of sharing a pivot cache, it is important to keep them in mind when determining whether using a pivot table as your data source is the best option for your situation.

## Saving time with PivotTable tools

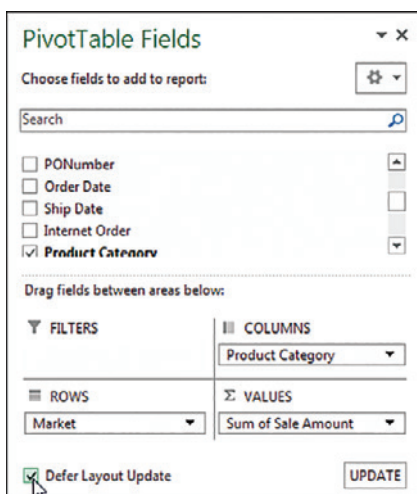

Microsoft has invested a lot of time and effort in the overall pivot table experience. The results of these efforts are tools that make pivot table functionality more accessible and easier to use. The following sections look at a few of the tools that help you save time when managing pivot tables.

### Deferring layout updates

The frustrating part of building a pivot table from a large data source is that each time you add a field to a pivot area, you are left waiting while Excel crunches through all that data. This can become a mad-dameningly time-consuming process if you have to add several fields to your pivot table.

Excel offers some relief for this problem by providing a way to defer layout changes until you are ready to apply them. You can activate this option by selecting the relatively inconspicuous Defer Layout Update checkbox in the PivotTable Fields list, as shown in Figure 2-34.

Here's how this feature works: With the Defer Layout Update checkbox selected, you prevent your pivot table from making real-time updates as you move your fields around without your pivot table. When you are ready to apply your changes, click the Update button on the lower-right corner of the PivotTable Fields list.

**FIGURE 2-34** Select the Defer Layout Update checkbox to prevent your pivot table from updating while you add fields.

**Note** Remember to clear the checkmark from the Defer Layout Update checkbox when you are done building your pivot table. Leaving it selected results in your pivot table remaining in a state of manual updates, preventing you from using other features of the pivot table, such as sorting, filtering, and grouping.

**Tip** Incidentally, the Defer Layout Update option is available through VBA. It can help improve the performance of any macro that automates the creation of pivot tables.

**Note** For detailed information on how to use VBA to create pivot tables, refer to Chapter 13, “Using VBA or TypeScript to create pivot tables.”

## Starting over with one click

Often, you might want to start from scratch when working with your pivot table layouts. Excel provides a simple way to essentially start over without deleting your pivot cache. Select the PivotTable Analyze tab and select the Clear dropdown. As you can see in Figure 2-35, this command enables you to either clear your entire pivot table layout or remove any existing filters you might have applied in your pivot table.

**FIGURE 2-35** The Clear command enables you to clear your pivot table fields or remove the applied filters from your pivot table.

## Relocating a pivot table

You might find that after you have created a pivot table, you need to move it to another location. It might be in the way of other analyses on the worksheet, or you might simply need to move it to another worksheet. Although there are several ways to move a pivot table, the easiest is Excel’s no-frills way: Select Move PivotTable from the PivotTable Analyze tab in the ribbon. This icon activates the Move PivotTable dialog, shown in Figure 2-36. All you have to do here is specify where you want your pivot table moved.

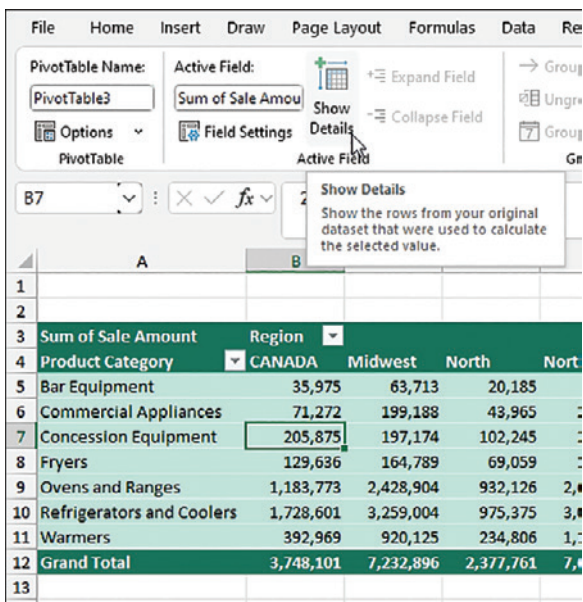

**FIGURE 2-36** The Move PivotTable dialog enables you to quickly move your pivot table to another location.

## Show Details for any cell in the values area

You’ve produced a pivot table and sent it to your manager, who takes one look at it and says, “This can’t be right! There is no way we sold \$205K of Concession Equipment to Canada!”

Any time someone questions one of the numbers in the values area of your pivot table, simply select the cell containing the value. On the PivotTable Tools tab, click Show Details (see Figure 2-37).

**FIGURE 2-37** Click any number in the Values area and then click Show Details.

Excel will insert a new sheet to the left of the current sheet. This sheet will contain a title indicating what cell was active when Show Details was clicked. There will be a blank row 2 and then all of the rows from the original data set that make up the selected number, as shown in Figure 2-38.

Before 2024, you could achieve this Show Details report by double-clicking any cell in the pivot table Values area. In 2024, Microsoft added the Show Details button to the ribbon and improved the result by adding the title.

	A	B	C	D	E	F
1	Details for Sum of Sale Amount - Product Category: Concession Equipment, Region: CANADA					
2						
3	Region	Market	State	Customer Name	Account Manager	PONumber
4	CANADA	CANADA	NB	ATLANT Corp.	Faxon Mundy	47980
5	CANADA	CANADA	NB	ATLANT Corp.	Faxon Mundy	50203
6	CANADA	CANADA	NB	ATLANT Corp.	Faxon Mundy	53527
7	CANADA	CANADA	NB	ATLANT Corp.	Faxon Mundy	71841

**FIGURE 2-38** Excel inserts a new worksheet to the left of the active sheet with all of the rows that make up the selected number.

If you use Show Details on the total number at the intersection of the Grand Total row and the Grand Total column, the Show Details report will be an exact copy of the entire original data set.

You can use Show Details over and over. Each time will create a new worksheet to the left of the active sheet. If you don't need these worksheets, you can press Ctrl+Z to undo; Excel will remove the new sheet.

## Next steps

In Chapter 3, you'll learn how to enhance your pivot table reports by customizing your fields, changing field names, changing summary calculations, applying formats to data fields, adding and removing subtotals, and using the Show As setting.
