# Acknowledgments

Writing a book is 50% research, 50% writing, and 50% editing and rewriting. Yes, it's a 150% effort. We're lucky to have amazing people supporting us.

We are grateful to our team at Pearson for their guidance and stellar work in turning our words into a beautifully-edited and published book. Special shout-outs to Nancy Davis, Laura Norman, Robyn Thomas, Tracey Croom, Scout Festa, and Kaitlyn Coddington.

We also need to thank our fabulous technical editor, Linda Caplinger. A veteran of search herself, Linda provided much needed perspective, support, and some outstanding ideas throughout this book. Her willingness to review content at the last minute so we could (kind of) make our deadlines was a flexibility we took far too much advantage of. We couldn't have done this without you, Linda.

A big “thank you” to the industry experts and brand executives who shared such helpful insights with our readers, especially Leslie Carruthers of The Search Guru, Kathryn Eyster of Tepper & Eyster, PLLC, Jimmy Daly of Superpath, Ellen Mowrer and David Gates of GrantStation, Janelle Levesque of Tapp Network, and John Beck of Beckwords. We also appreciate our highly-respected colleagues who went above and beyond in their support of this book: Ryan Jones of SERPRecon, Mark Traphagen of seoClarity, and Rachel Heseltine of Paramount, who was the inspiration for many of the funnier screen-shots we used.

## Note from Catherine Seda

I am ever so grateful to my creative soulmate and husband, Phil, for encouraging me to write this book and supporting me throughout the process, even when I was on a “countdown to a meltdown” during deadline sprints—it's so time for a spa day. And to my wonderful mom for her comforting and cheerleading spirit.

To my dear friends and colleagues who offered coffee, chats, hugs, and memes. An extra big hug to Sara, Laura, Rocio, Dawn, and Julie.

## Note from Jenny Halasz

The unsung heroes in an author's life are the people who quietly support from the sidelines. I'd like to thank my family and chosen family for standing by me, supporting me and still loving me despite my obsession with completing this book. My son Brian, who was always cheering me on, my son Daniel, who occasionally talked shop with me about the content, and my amazing husband Neil, who picked me up when I was down, kept me going with fresh coffee every morning, and put up with my frantic pushes to (almost) meet deadlines.

Mom and Dad, thanks for always letting me forge my own path and being a constant source of support and love.

My chosen family: Josh, Claire, Stephen, Dan, Kelli, and too many more to name you all, thank you for supporting me and giving me the confidence to make this dream happen.

## To Each Other

We started this journey not knowing if we'd even write well together, and what we found was a beautiful synergy of thought, ideas, and inspiration. We wrote every word in this book together, collaborating on each line to make it perfect. We hope it shows in the finished work.

## About the Authors

**Catherine Seda** is a digital and content marketing strategist, author of three books, former *Entrepreneur* magazine columnist, and freelance writer with deep experience in SEO and PPC copywriting. She brings more than 20 years of leadership and consulting to agencies, small businesses, and corporate brands including LL Flooring, Yelp, eBay, Kelley Blue Book, and American Honda Motor. Known for bringing together teams, Catherine fuses creativity, SEO, and AI to power content strategies that amplify brand authority and business impact—without losing the human element.

**Jenny Halasz** is a technical SEO, content marketing strategist, and author with more than 20 years of experience helping brands succeed online. She has worked with companies like Humana, SAP, LL Flooring, and NVIDIA across e-commerce, education, and healthcare, specializing in technical SEO, content strategy, and data-driven optimization. A sought-after speaker and contributor to Search Engine Land and Search Engine Journal, Jenny is passionate about decoding AI's influence on search, SEO, and customer experience to drive growth.

## About the Technical Editor

**Linda Caplinger**, a veteran of the search industry since 2000, has held Enterprise SEO and onsite search roles at Infoseek Search Engine (later part of Disney Internet Group), Yahoo!, McAfee, Symantec, and SAP, and has consulted for major brands such as Microsoft and Logitech. She is presently the Global Lead of Integrated Search Marketing at NVIDIA Corporation, where she has dedicated the past 14 years to advancing SEO, SEM, AI-powered optimization, and corporate domain management.

Linda has played a central role in building powerful onsite search programs—leveraging the Google Search Appliance (GSA) for Symantec, McAfee, and SAP—and has led NVIDIA's transformation in customer-facing search. Her team launched a Solr-based platform, explored Google Vertex proof of concepts, and ultimately developed a proprietary hybrid generative search solution integrating Solr with NVIDIA Chimera and Librarian technologies.

Working as an enterprise in-house SEO, Linda is one of the quieter of her search community tribe, but occasionally gets out to speak at industry-leading conferences including Conductor C3, Pubcon, and SMX Advanced, sharing insights and championing the power of search innovation wherever she goes.

# Foreword

Artificial intelligence moves fast. Really fast.

By the time you read this sentence, there's a very good chance AI will have changed so substantially that any advice I could give you today about which tools or tactics to use would be hopelessly out of date.

Case in point: I recently had to redo an entire demo of a new AI tool just 24 hours after recording it, because the tool itself changed entirely after barely a week on the market.

("Keeping up with AI keeps me on my toes," I write, as I brush out of my eyes a new batch of gray hairs that I didn't have yesterday.)

Jokes aside, the speed at which AI moves is why books like this one *matter*.

It's packed full of timely and actionable advice for any content marketer or SEO who wants to get ahead with AI. But it also goes deeper by providing a strategic approach to AI based on first principles so that anyone, at any time, can integrate AI responsibly into their content marketing and SEO strategy.

Tools and tactics change. The underlying strategy and principles of responsible AI adoption don't. This book doesn't just set you up to succeed with AI next quarter; it sets you up to succeed with AI over the life of your career and business.

It does all that by putting at the forefront an ingredient often missing from the AI conversation:

Humans.

This book isn't about automating away your content marketing or SEO work. It's not about using AI to ruthlessly pare expenses to the bone. And it's not about pitting people against machines to eke out another few percentage points of business advantage, regardless of the human cost.

It's about how to ethically and responsibly adopt the radical new power of AI in any industry, in balance with human strengths like creativity, judgment, and empathy.

Unfortunately, what this book cannot do is stop time: AI continues to hurtle forward at lightspeed. But with the principles and strategies contained in it, you'll be ready for the future when it arrives.

No matter how fast it gets here.

Mike Kaput  
Chief Content Officer  
Marketing AI Institute  
<https://www.marketingaiinstitute.com>

# Introduction

AI is here—and it's evolving at an explosive pace.

It's impacting organizations across countries, industries, and teams. The generative capabilities of AI make it a game-changer for marketing, especially for content marketing, where text, images, audio, and video can be created exponentially more easily and quickly. AI is exciting in terms of efficiency and scalability, but it also comes with great risk. As marketers, we've experienced this firsthand.

We are Jenny Halasz and Catherine Seda. We have worked in digital marketing for more than 20 years and presented at search marketing events, but we didn't meet until we collaborated as Head of SEO (Halasz) and Head of Content Marketing (Seda) at LL Flooring.

Although we were learning about AI the past few years, we watched a story play out at LL Flooring that several of our industry colleagues have seen in their daily work as well. Initially, LL Flooring had no AI policy. That meant that as AI tools became available, some employees adopted them to make their daily work more efficient. Panicked about risk and exposure, the company blocked AI tools but didn't create an AI policy. The team continued to use AI tools on their personal computers, which were even less secure than their company machines. Obviously, this was not an ideal situation.

Blocking AI tools also crippled the Search Engine Optimization (SEO) department. For months, the SEO team had been making do with limited headcount by using AI tools to automate tasks like creating titles and meta descriptions, with one employee performing the work of three people. Cutting off access to this critical time-saving resource was catastrophic for the SEO team.

When we left LL Flooring and stepped back into the marketing industry at large, we realized that there are books about how to write AI prompts and how to get rich quick with AI automation, but not much on how to integrate AI responsibly into a content marketing and SEO strategy. So that's what we've set out to do here. Instead of focusing on specific AI tools, which will quickly outdate this book, we've focused on a strategic and practical approach to AI that we would want to read as marketers.

In case you're wondering if AI wrote this book, it did not. But it did inspire ideas and research, including several examples of AI gone wrong that we've shared here.

Whether you're exploring, adopting, or innovating, we want to support your AI journey in a way that optimizes the technology opportunity without compromising your brand or business goals. We hope this book continues to be relevant as the AI landscape continues to evolve.

## Who Should Read This Book

Our book is a guide to AI transformation in content marketing and SEO, and insightful for marketers across all disciplines: creative (copy, design), performance (email, paid media, SEO, user experience), and communications (PR, social media, investor relations). That's because content plays a role in nearly every marketing effort, and understanding AI in content marketing is essential. There's a reason even SEOs say, "Content is king."

This book is also beneficial for teams that collaborate with marketing, such as sales, customer support, analytics, and even development teams. Sales and support can leverage AI-generated content for communications, while analytics evaluate content marketing and SEO performance. Executives (C-level, legal, HR, IT) will find value in this book as they develop generative AI marketing strategies within a broader company AI strategy.

Finally, college students and recent graduates who are our next generation of marketers will benefit from understanding AI's role in content marketing and SEO. Tools change. Tactics change. Those who understand AI strategy well enough to implement it will have a competitive edge in this job market and in the future.

## What This Book Does and Doesn't Cover

This is not a technical or step-by-step book. AI is changing quickly. This book does cover key concepts, use cases, and actionable recommendations that you can use to incorporate AI into your content marketing framework, with special consideration for SEO. This book does not promote a fully automated approach to generative AI (GenAI); it's a guidebook for businesses, brands, and regulated organizations to use GenAI responsibly, ethically, and with human oversight to minimize risks while improving productivity.

## How This Book Is Organized

We begin by exploring the current landscape and giving you a crash course in how AI works. Then we focus on key principles that AI content marketing must address to meet customer needs and keep pace with Google's evolving algorithms.

The next few chapters will help you navigate the risks and opportunities inherent in generative AI and will recommend guidelines with which you can better protect your business. We'll look at ways you can leverage AI to streamline content marketing operations and how it's taking analytics to the next level.

Finally, if you're working for an e-commerce company, a nonprofit, or a regulated industry, check out the chapters we wrote for those specific industries, as they include unique AI challenges and opportunities you'll want to understand. Whether your industry is covered in detail or not, you will find value in those chapters.

Ready to use AI to power your content marketing and SEO? Let's dive in.

<https://www.linkedin.com/in/catherineseda/>

# AI's Impact on Marketers

*AI is a game-changer for marketers.*

*It's time to level up.*

For years, we marketers have been tasked with doing more and producing more. It's exhausting. Even in leadership roles where we focus on marketing strategy, we're often busy in meetings or fighting fires, including broken tracking code, budget reconciliations, and data discrepancies. We rarely get resources to help... until now.

Executives are drooling over artificial intelligence (AI). It's so shiny, with its promise of massive cost-savings and productivity. Some executives are thinking, "AI can spit out 100 blog articles for SEO? Great. Let's also use AI to send mass emails, create all our social media comments, design our brand campaign assets—let AI scale marketing!"

Not so fast.

AI is not a magic button. You can't press it and forget it. It's a tool. Yes, it's a powerful tool for marketers that absolutely helps with content marketing and search engine optimization (SEO). When properly wielded, AI drives efficiencies. However, before we explain how marketers can integrate it effectively into their work to improve productivity without damaging consequences, let's see how the AI revolution is impacting content and SEO, and what this means for marketers.

## Content Marketing and SEO Transformation

When done correctly, content marketing is effective but can be painful. The process is manual and slow and requires many resources. Think about the steps and time it takes at a corporate brand to develop and publish a piece of content, like a blog article, for example.

At LL Flooring, where we both previously worked, when a blog article was delivered by our partner agency, it then passed through five internal teams—creative, brand, content, SEO, and e-commerce—though not in a linear order. Additionally, the installation or merchandising team would review the article if their subject matter expertise was needed. An article could take weeks to move through this workflow, and occasionally it got lost or stuck within a team. Sound familiar? Although we streamlined the blog workflow across teams, the manual processes of writing, editing, optimizing, fact-checking, and publishing a blog article were still cumbersome.

**AI-powered content marketing is faster, smarter, and more data-driven.**

Here are a few use cases and examples of AI content marketing in action:

- **Faster:** Repurpose one webinar into a transcript, blog articles, social media posts, and an email newsletter within minutes or hours instead of days.
- **Smarter:** Automatically adjust website content, like the homepage banner with a relevant call to action, in real time based on the user's previous interactions or geographic location.

- **Data-driven:** Predict which website pages are more likely to get increased traffic and generate content briefs with SEO in mind significantly faster, so the team can prioritize optimizing those pages.

AI helps brands save time and resources while delivering better experiences to their audiences. AI empowers marketers to improve their productivity and results, not just content marketers but SEOs (search engine optimizers) too.

**NOTE:** In the digital marketing industry, it's common to refer to SEO as search engine optimization and to SEOs as search engine optimizers.

AI-powered SEO tools and AI features within long-standing SEO platforms are now available. Thanks to AI's ability to analyze huge amounts of data, it can recommend keyword strategies better and predict user trends. This saves SEOs weeks of time wading through data looking for patterns and opportunities. AI is not an SEO strategist. With the insights it can provide, SEO leaders can invest more time in building effective strategies and processes. And they'll need to spend more time on SEO strategies, because AI is changing the search experience too.

Chances are you've noticed something different about Google lately. When you search on a topic, you may see an AI-generated snippet of information displayed at the top of the organic search results. These snippets are meant to provide helpful information without requiring you to click through to visit a website or multiple websites. Unfortunately, these snippets aren't always reliable. That's challenge number one. Another challenge is that now SEOs and content marketers need to focus on optimizing their website content to increase the chances of appearing in these snippets, as these are receiving priority placement over organic search engine listings. We'll dig into the reasons behind why AI-generated search results have varying levels of usefulness in Chapter 3, "Search, Personalization, and SEO," as well as what you can do to address the issues.

Now that you understand the high-level impact of AI on content marketing and SEO, you may be wondering what this means for your role and your future career. We pulled together research to help content marketers and SEOs understand the job market and what next-level skills are becoming increasingly important.

## The Changing Job Market

At a global level, the overall job market looks promising. According to the World Economic Forum's "Future of Jobs Report 2025,"<sup>1</sup> by 2030, AI and other technologies will displace 92 million existing jobs but will create 170 million jobs. An increase of 78 million new jobs is great news.

Then why does the job market feel so difficult for marketers right now?

Economic pressures and AI advancements have been fueling a volatile job market the past few years.

According to LinkedIn's "2024 Global Marketing Jobs Outlook" report,<sup>2</sup> widespread layoffs impacted many marketers, and "job postings fell 42 percent in 2023 compared to 2022." Although LinkedIn reported a 76 percent increase in marketing job postings from 2023 to 2024, it's important to note that these reflect job listings and not necessarily roles that were actually filled. A percentage of postings are never intended to be filled, or may be completely fake, but they are created to collect résumés or the illusion of company growth.

So if your career ride has had more ups and downs than a rollercoaster these past few years, you're definitely not alone. We've been there too, along with colleagues across marketing roles—from copywriters to chief marketing officers (CMOs).

According to a 2025 survey by Superpath, a career resource for content marketers, the job market is still tough. In Superpath's "Content Marketing Salary Report" updated for 2025, more than 40 percent of respondents believe the current content marketing job market is "weak" or "very weak."<sup>3</sup> Although only 13 percent of content marketers surveyed reported they were laid off in 2024, as opposed to 16 percent in 2023, content marketers are dealing with layoffs. AI is a high contributor.

3 <https://www.superpath.co/blog/content-marketing-salary-report>

## AI CHALLENGES IN THE JOB MARKET

AI is creating challenges for both job seekers and employers. Applicants are struggling to get past AI screening tools, while employers are overwhelmed by fake applicants seeking to obtain control of private company systems. Globally, one in four candidate profiles is expected to be fake by 2028, according to research firm Gartner.<sup>4</sup>

As marketers, we get anxious hearing stories about AI replacing human jobs. Klarna, a Swedish financial services company, reported that AI has saved the company about \$10 million in annual savings, partly through using AI tools to replace human efforts for graphic design, social media, translation, and production.<sup>5</sup> Klarna's CEO, Sebastian Siemiatkowski, said that "AI may help the company reduce headcount from 4000 to 2000 employees" by heavily using AI in marketing and customer service.<sup>6</sup> Wow, that's concerning.

Our goal in sharing AI's potential impact on marketing jobs isn't to cause panic, but to encourage awareness and preparation. This book will help you become an AI marketing strategist so you can level up in your career. To help you understand what the future of content marketing could look like and how you can better prepare, let's review salaries, valuable skills, and freelance opportunities.

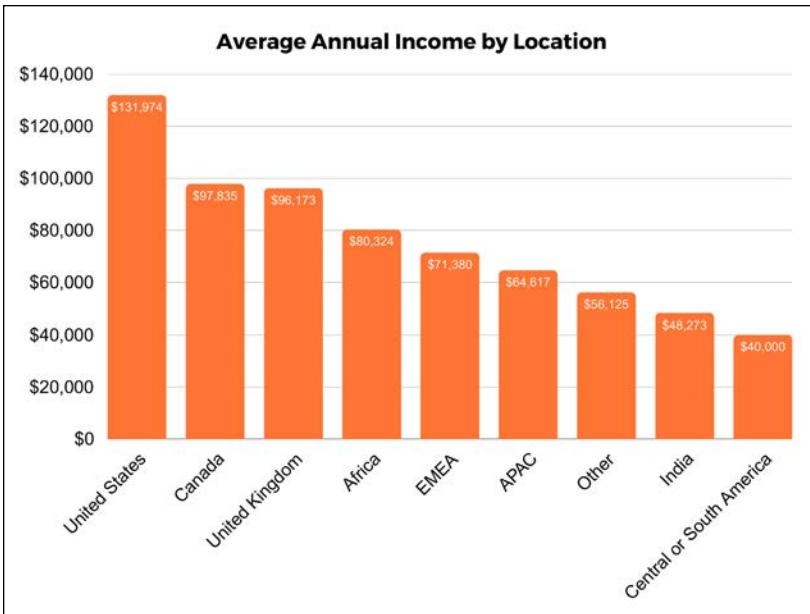

## Content Marketing Salaries

Keep in mind that salaries vary depending on multiple factors, such as geographical location, years of experience, job title, and market conditions. You can use sites like LinkedIn or Indeed to research open job postings and see current salary ranges for various content marketing positions. We think knowing industry averages helps with personal benchmarking and salary negotiations; however, before asking for a higher salary in a job offer or promotion, we highly recommend doing your own research. That said, the Superpath salary report shows the average annual income of the content marketers surveyed by regional location (**Figure 1.1**) and by job title (**Figure 1.2**). The data in these figures gives you a starting point to determine the salary range you can expect.

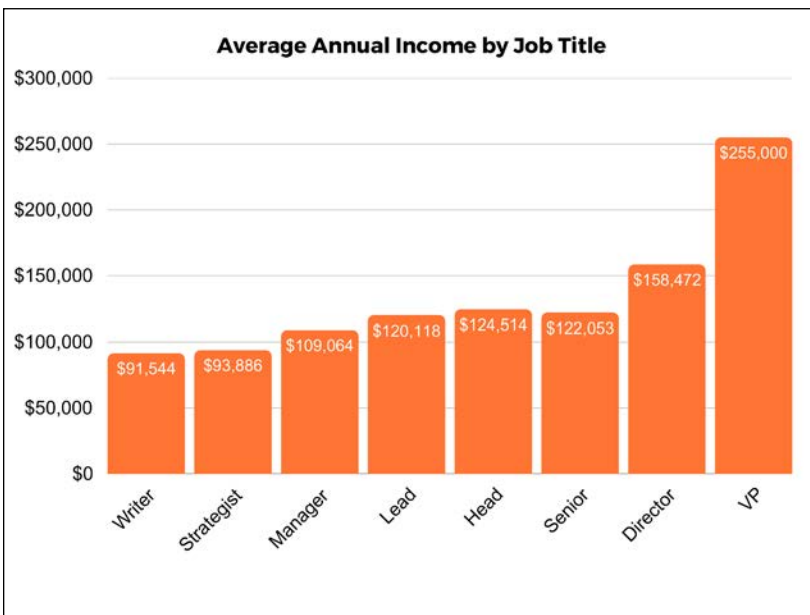

4 <https://www.gartner.com/en/newsroom/press-releases/2025-07-31-gartner-survey-shows-just-26-percent-of-job-applicants-trust-ai-will-fairly-evaluate-them>

5 <https://www.wsj.com/articles/klarna-marketing-chief-says-ai-is-helping-it-become-brutally-efficient-4ad388d3>

6 <https://www.bbc.com/news/articles/c80e1gp9m9zo>

**FIGURE 1.1** Income by location, "Content Marketing Salary Report," by Superpath

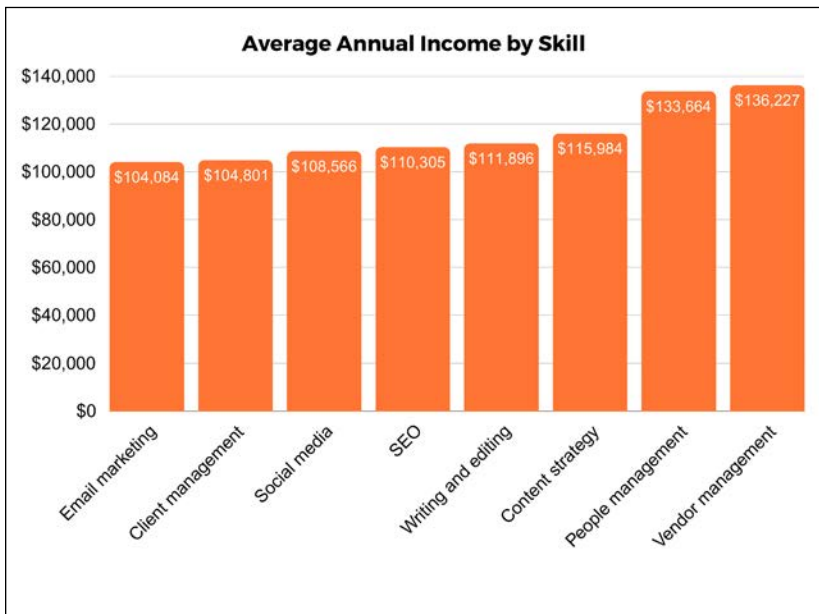

**FIGURE 1.2** Income by job title, "Content Marketing Salary Report," by Superpath

For our U.S. audience, we want to clarify that the average salary of \$132K for content marketers seems a bit high. Superpath's income data includes people who supplement their income with freelance work, and it also includes executive roles; that's why we've included average annual income broken down by job title.

For our non-U.S. audience, be aware that 61 percent of the content marketers surveyed in Superpath's report are based in the U.S., which means the average income by job title is more heavily influenced by U.S. salary data.

We think income by job skill is interesting too (**Figure 1.3**). Marketers have become more specialized over the years. Many companies are looking for specific disciplines or expertise.

**FIGURE 1.3** Income by skill, "Content Marketing Salary Report," by Superpath

At a small company or startup, a content marketing generalist or individual contributor wears many hats. A generalist often writes and publishes content on the company's blog, social media, email newsletter, and other marketing channels.

In larger companies, there can be a head of content marketing who directs the strategy and brand storytelling and collaborates with leaders of other teams, such as brand, creative, SEO, email, paid media, and analytics. In corporations with multiple brands, there may be a dedicated content marketing leader for each brand or group of brands. Content marketers, who may report to the content leader or a channel leader, are responsible for producing or publishing content for channels like social media or email. These marketers need to become fluent in AI tools that help them create or execute more of that content faster. Your value as a content marketer, however, isn't solely in knowing how to use AI tools. AI demands a complementary set of skills from content marketers—regardless of your job title or channel focus.

## Next-Level Skills

Certainly, understanding AI strategy in content marketing is essential. However, as you'll learn in Chapter 7, "Marketing Operations and Automation," AI falls short in some areas. Human oversight is necessary. Now with the technological advancements of AI, it's time to level up your soft skills.

In "TheFuture of Jobs Report 2025," the World Economic Forum lists the core skills employers consider essential for their workforce, and a majority of the top 10 emphasize the importance of critical thinking, communication, and adaptability.<sup>7</sup> This makes sense in the age of AI, when humans should be using their cognitive abilities to complement and enhance the capabilities of AI. These soft skills become even more valuable as AI takes over routine tasks, highlighting the need for marketers to focus on areas that require complex decision-making and human insight.

Employers may offer courses or stipends for educational training. Reach out to your human resources or learning and development team to learn about your options. Some employers may provide reimbursement to learning platforms like Coursera, LinkedIn Learning, or Udemy. Or you can explore these on your own.

**TIP:** Learn the soft skills and AI implementations that prove your value before a manager asks, "Why can't AI do your job?"

---

7 <https://www.weforum.org/publications/the-future-of-jobs-report-2025/>

Unfortunately, most companies have not caught up on AI training for employees. According to the Marketing AI Institute's "2025 State of AI Report," 62 percent of marketing and business professionals surveyed said the lack of education and training is the top barrier to adopting AI in their marketing.

It's up to us, as marketing employees or contractors, to educate ourselves. In addition to reading books, consider AI marketing certifications for a hands-on learning experience (we've listed several in Appendix A, "Tools and Resources," and you'll find a plethora of options online). Academic institutions are starting to offer AI marketing certifications to professionals and integrate AI courses into marketing degree curricula. We suggest searching for job listings for your specialty area (SEO, social media, email) or role function (copywriter, graphic designer, ecommerce manager) to see which AI tools employers mention most often. Some offer certifications specific to their tool, which can help you in a competitive job market.

We see another way for marketers to develop an AI education: freelance.

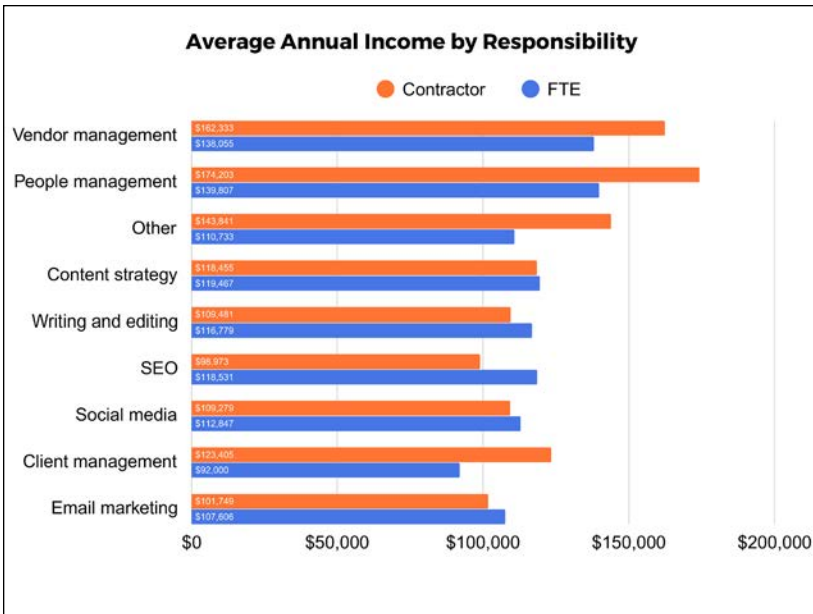

## Freelance Opportunities

Whether a side gig or a stopover on the way to full-time work, try freelance work. It's not a bad idea to have a side hustle that requires AI, especially if your current employer doesn't have an AI policy that prohibits it. This is one way to get hands-on AI experience. We've spoken with several colleagues who are employed but aren't allowed to use AI at work. They worry about having an AI skills gap if they are laid off or have to start looking for their next job. It's a valid concern. Stay ahead of the curve by preparing now.

If you want to freelance, first review your employer agreement for any restrictions. Then check out the marketing services other content marketers offer in Superpath's chart, which breaks down income by contractor and full-time employee (FTE) classifications (**Figure 1.4**).

**TIP:** If freelance marketing work isn't an option, make learning and using AI a hobby. There may be a volunteer position you can take or a friend or family member you can help in a way that allows you to learn and use AI tools.

**FIGURE 1.4** Income by responsibility, “Content Marketing Salary Report,” by Superpath

We’re happy to see writing as an opportunity for freelance work because we personally know talented writers who’ve been hit hard in this job market, particularly with the rise of AI writing tools, and writers are usually on the lower end of the content marketing pay scale. The same can be said for creative marketers such as graphic designers, photographers, and video producers, who aren’t included in Superpath’s chart.

The freelance market is competitive, as noted by Superpath CEO Jimmy Daly, who explains this market is typically top-heavy, meaning only a small group of individuals make a lot of money (seven out of 74 freelancers reported making more than \$200,000 in the Superpath report). But at least freelancing can be a good way to supplement your income. We’re not recommending you quit your day job without savings, but freelancing can be a valuable way to earn extra income while developing your AI skills. It could even be a launchpad to becoming a solopreneur or starting your own marketing agency.

It’s a compelling time to freelance or launch a small business now that AI can assist with so many business tasks, giving solopreneurs the kind of support that used to require a team. We won’t dive into business opportunities in this book, but researching the current labor shortages in your area may be worth the time investment. For example, there’s a

growing demand in many places for health, education, or home services like landscaping or cleaning. Or you could start a personal project that you're excited about. You'll benefit by using your AI content marketing skills in your own business or a fun hobby.

## A Future-Proof Framework

The hype of the AI revolution has already passed. Many companies are actively integrating AI into their marketing operations. In the age of AI, marketers and brands need a future-proof framework to get ahead and stay ahead.

### For Marketers

Certainly, the importance of having a firm grasp on AI tools relevant to your content marketing role goes without saying. You may be using AI content marketing platforms like Copy.ai, Jasper, or Writer; or conversational AI tools like ChatGPT, Claude, Copilot, Gemini, or Perplexity. Another possibility is that you're using channel-specific tools like SEMrush or Ahrefs that have integrated AI capabilities into their SEO platforms.

We believe the core pillar to your success as an AI content marketer is *strategy*. Content creation is one thing. It's quite another to understand the opportunities and liabilities of AI and how to best integrate it into your marketing process to maximize efficiency with minimal risks to your employer's brand or business. As much as every brand must prioritize customer experience, marketers are the ones on the front lines, ensuring that content aligns with customer needs and delivers value. As you'll read in Chapter 4, "Authenticity and Authority," creativity plays a big role. It's up to you to find ways to keep the brand's voice and values in content instead of letting AI kill it.

A common complaint from content marketers is feeling undervalued. That's likely because content marketing return on investment (ROI) is often tied to long-term results like brand awareness and reputation, so it's hard to measure results in real time. Although later in the book we highlight key content marketing metrics and how AI is changing analytics, we encourage all content marketers to improve their data analytics knowledge. You don't need to become certified, although that wouldn't hurt. Content marketing leaders should collaborate with analytics leadership on key performance indicators (KPIs) for content marketing. Team members should ask leaders what those

KPIs are, and how to align their work to them. Although job security is never guaranteed, demonstrating content marketing performance improves your chances of staying and thriving within the company. Understanding analytics is an important steppingstone toward a leadership role.

## For Brands

Our top recommendation for corporate brands is to develop a company-wide AI strategy, along with department-specific strategies. Establishing an AI framework first will help your teams avoid costly mistakes later. This framework should include goals for AI development and use. It should also include AI policy (rules) and governance (operations). Chapter 6, “Bias, Ethics, and Legal Risks,” includes guidance for creating a policy and governance strategy. You should also consult with legal counsel experienced in advising on AI use in the workplace.

To support your teams in the effective integration and use of AI technology, we highly recommend investing in AI training for employees. Ask your human resources team to explore AI workplace training services that may be provided by the employee learning or team management platform your company uses. Be sure your training covers your AI policy, what should be included in an AI policy, and who should be involved in developing it. We will explain this in more detail in Chapter 6. We also strongly encourage you to update your employee security training to include AI-related issues and safety best practices.

Companies should not solely focus employee training on policy and security. Each team using AI should receive ongoing departmental training and participate in routine audits to identify effective use cases, surface questions or concerns, and identify potential risks as AI use evolves within the organization. Employee AI education is valuable in future-proofing your company against changing technology and regulations. It will also significantly boost productivity.

We stress the importance of human supervision of AI in content marketing and SEO throughout this book. Yes, you can automate many tasks to cut costs and gain efficiency. But keeping human oversight is crucial.

Finally, every company must prioritize the customer experience when using AI. For small businesses looking to build a brand, a unique voice stands out. For larger companies, irresponsible use of AI in content marketing can damage the brand, trigger SEO issues, and become an expensive legal liability.

## Introduction to AI Definitions and Concepts

People can mean different things when they talk about AI. So before we jump into discussing how it can be applied to content marketing and SEO, we think it's essential to define the terms you will use. Although many other sources have a comprehensive glossary of AI terms, we've included a few important definitions that we'll refer to throughout this book. If you'd like to read a bigger glossary, check out the "AI Key Terminology" web page on the U.S. General Services Administration website.<sup>8</sup>

**Artificial intelligence (AI)** refers (at a high level) to machines that can simulate human intelligence by using feedback loops of data to "learn" with minimum human intervention. AI is generally used to process volumes of data that are beyond the scale of what a human can analyze. AI-powered tools can help content and SEO marketers with their work.

**Algorithms** in very simple terms are any processes or sets of rules used to solve a problem or complete a calculation. Although an algorithm may run repeatedly with new information each time, or multiple algorithms may run together, they are finite, meaning they will inevitably reach an endpoint.

**Machine learning (ML)** is a broad concept that refers to computer systems drawing inferences from data. Machine learning uses one or more algorithms and statistical models to analyze data. Machine learning without natural language processing (NLP) is algorithmic AI. Machine learning with NLP is generative AI (GenAI). GenAI is what most of this book is about, so we cover it and explain NLP in more detail in the "Generative AI Tools, Assistants, and Agents" section in this chapter.

**Algorithmic artificial intelligence (AAI)** refers to mathematical AI systems that go beyond fixed rules, essentially "talking" to other computers to analyze information and make decisions. AAI is used in scientific and medical applications, such as detecting early signs of breast cancer that may be missed by doctors by comparing a patient's images against large training datasets of previously diagnosed medical images. Google has been using AAI since 2001<sup>9</sup> in various aspects of their services.

---

8 <https://coe.gsa.gov/coe/ai-guide-for-government/what-is-ai-key-terminology/>

9 <https://blog.google/technology/ai/google-ai-ml-timeline/>

**Generative artificial intelligence (GenAI)** is what most of us now think about when we think about AI. It's a type of deep machine learning that seeks to generate new data (text, images, or other content) based on a set of training data. Chat GPT (text) and DALL-E (images) are popular tools based on GenAI, which is what most marketers or SEOs use when they use AI to help them in their work. We cover this in more detail in the “Generative AI Tools, Assistants, and Agents” section.

**Natural language processing (NLP)** is a subfield of AI that uses machine learning, and in some cases deep learning, to communicate with users in natural human language. NLP is tricky to understand because it can appear that the AI is “learning.” What the AI is actually doing is taking in new information. This can happen through supervised or unsupervised “learning,” as we discuss in the following sections. Although NLP can be used in any AI implementation, it is most commonly used in GenAI.

**Neural networks** in humans are the interconnected nodes and neurons in the brain that allow the brain to absorb, assimilate, and process new information. Artificial neural networks are modeled after the human brain but (currently) lack the ability to apply ethics, morality, or other non-defined decision structures to decision-making. Artificial neural networks use multiple nodes in layers to accomplish complex calculations and arrive at a decision. More than three layers of nodes is classified as *deep learning*.

**Deep learning (DL)** is a form of machine learning that uses multiple neural networks to simulate the processes that occur in the human brain. The computer can assimilate new information but cannot “learn” the way a human can. Deep learning is what makes it possible for GenAI to produce relevant, high-quality content for SEOs and content marketers.

**Large language models (LLMs)** are a type of deep learning model that are pre-trained on very large sets of data. LLMs are used for NLP to create text or responses that seem like they were written by a human. ChatGPT is a popular GenAI tool based on LLM technology. If you've used it, you may know that the accuracy of its responses is limited based on the data it was trained on and when that training data was last updated.

**Supervised learning** happens when information is intentionally introduced to an AI system using labeled data, meaning that input data is paired with corresponding output data. Clear instructions are given to train the AI system. However, supervised learning can still be risky if the

training dataset accidentally includes personally identifiable information (PII) or the input data is incomplete. This is of particular concern in the health, education, and government uses of AI, as we discuss in Chapter 11, “AI in Regulated Industries.”

**Unsupervised learning** occurs when the AI system is provided with information that is not clearly labeled with input–output pairs and the AI is expected to make its own conclusions about how to connect the information. This commonly occurs when LLMs are updated with more recent crawls of content. ChatGPT is an excellent example of an AI that “learns” unsupervised. This opens potential legal and ethical issues that we go over in Chapter 6.

**Hallucinations** occur when an AI delivers an inaccurate or incorrect conclusion. This happens because the data it’s working with is limited, incomplete, or incorrect. This can commonly occur with unsupervised learning. Hallucinations are a nightmare for marketers and brands if AI generates content that misleads consumers, makes harmful claims, or violates regulations. We’ll cover ways to reduce the impact of hallucinations throughout this book.

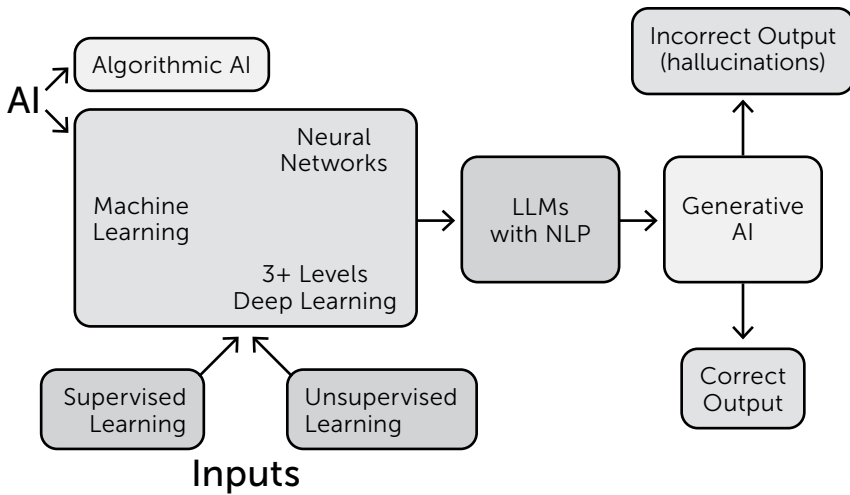

#### WARNING ABOUT HALLUCINATIONS

Be aware that hallucinations can be dangerous and can keep creators of AI systems awake at night. There are dozens of examples, but perhaps none so instructive as Meta’s Galactica. For three days after it launched, Galactica spit out nonsensical, biased information instead of helping scientists, as it was intended to do.<sup>10</sup> Perhaps most humorously, it cited a fake scientific paper, attributed to a real author, about the origin of bears in outer space. Meta pulled the project almost immediately.

If you’re already overwhelmed with these glossary terms, that’s OK. The graphic in **Figure 1.5** may help. Now that you have an overall understanding of several important concepts in AI, let’s talk in more detail about generative AI, which is particularly relevant for content marketing and SEO.

---

<sup>10</sup> <https://www.technologyreview.com/2022/11/18/1063487/meta-large-language-model-ai-only-survived-three-days-gpt-3-science/>

**FIGURE 1.5** How AI works, simplified for marketers

## Generative AI Tools, Assistants, and Agents

The next evolution of AI is already happening as we write this book. *AI agents* are the new buzzword. To fully understand AI agents, we need to explain GenAI a little more.

### Generative AI (GenAI) Tools

Generative AI is what makes AI tools accessible to the non-technical person. It takes computer language and “translates” it into human language using LLMs. GenAI tools create new content, such as text, images, audio, video, or code, based on an instruction (“prompt”) given to them and an expected output style (text, image, code, and so on). Examples of these that you may already use include ChatGPT, Claude, DALL-E, Sora, and Suno. Most of the information we cover in this book pertains to GenAI tools.

### AI Assistants

AI assistants like Apple Siri or Google Assistant are popular tools that use GenAI. They also use personal data about you and your habits to help you complete tasks. You can ask your assistant to tell you your schedule or make a dinner reservation. Here’s an example assistant prompt:

*“Hey Siri, make a reservation for dinner at 7 p.m. today at Corner Bistro.”*

The AI assistant may use your OpenTable app to make the reservation.

# AI Agents

AI agents are the next evolution in AI capabilities because they can use multiple GenAI tools together to perform a task or make a decision. The key difference between an assistant and an agent is that you must tell an assistant what you want. An agent can use other information to determine the best response.

In the dinner reservation example, you can use an AI agent to complete a more esoteric task.

*“Hey agent, I want to go to dinner on Friday.”*

The agent can use multiple tools or even other agents to autonomously make you a reservation at Corner Bistro and respond with something like

*“I made you a reservation at Corner Bistro because it has great reviews and is near your office. The best available time was 7:15 p.m.”*

The key is that if you ask an agent a question, it has more than just the defined ways it can respond. For example, if you ask the agent to define a complicated process, it may choose to respond with an image of a flow-chart of the process. Agents can also “learn” to start tasks on their own, to work with other agents to complete multi-step processes, and to take proactive measures without being told. **Table 1.1** shows a comparison of an AI assistant with an AI agent.

TABLE 1.1 AI Assistants vs. AI Agents	
AI ASSISTANTS	AI AGENTS
Reactive	Proactive
Respond to a specific prompt	Determine how to achieve a provided goal
Complete simple tasks	Make decisions, complete complex processes

With a diverse range of business applications, it’s no wonder the market for AI agents is expected to skyrocket. The Boston Consulting Group reports that AI agents are becoming more prolific across technology applications, growing with a 45 percent compound annual growth rate over five years.<sup>11</sup>

11 <https://www.bcg.com/capabilities/artificial-intelligence/ai-agents>

You may be familiar with AI agents for social media bots like Sprout Social's Smart Inbox or business process agents like NVIDIA's Eureka or Microsoft's Copilot Studio.

*"Agents open up a whole set of opportunities for working with people and getting tasks done, and that's what we expect from AI systems. AI agents are not only a way to get more value for people but are going to be a paradigm shift in terms of how work gets done."*

—Ece Kamar,  
Managing Director, Microsoft's AI Frontiers Lab<sup>12</sup>

What's truly remarkable is that tools like these can autonomously interact with users, make real-time decisions, and improve their responses to accomplish tasks or goals more effectively. However, because AI tools and agents rely on other datasets rather than on novel ideas, they can still make costly mistakes for a brand, which we'll explore later in this book.

## Don't Fall Behind—Evolve with AI

This is an exciting time, and a nerve-wracking time, for marketers and brands. AI technology is quickly changing the way marketing works.

As companies race to adopt AI for faster, smarter marketing, we encourage leadership to equip their teams with the training needed to skillfully shift to AI-powered content and SEO marketing. Empowering your marketing team is key to keeping your brand competitive.

Most employers don't yet offer AI training. When they do, it's likely to focus on company-wide AI policies rather than marketing-specific applications. So take charge of your own education and career growth by getting hands-on experience with AI, whether in your current role, in a side project, or both. Use the job market insights from this chapter to identify soft skills you may want to sharpen, as these are becoming increasingly important. Now that you have a better understanding of relevant AI concepts and definitions specific to marketing, let's move on to strategy.
