Getting Started

Welcome to the official Apple Pro Training Series course for Logic Pro 9 and Logic Express 9. This book is a comprehensive introduction to professional audio production with Logic Studio. It uses real-world music and hands-on exercises to teach you how to record, arrange, mix, produce, and polish audio and MIDI files in a professional workflow. So let's get started!

The Methodology

This book takes a hands-on approach to learning the software, so you'll be working through the project files and media on the accompanying DVD. It's divided into projects that methodically introduce the interface elements and ways of working with them, building progressively until you can comfortably grasp the entire application and its standard workflows.

Each lesson in this book is self-contained, so you can jump to any lesson at any time. However, each lesson is designed to support the concepts learned in the preceding lesson, and newcomers to audio production should go through the book from start to finish. The first seven lessons, in particular, teach basic concepts and are best completed in order.

Course Structure

The book is designed to guide you through the music production process as it teaches Logic. The lessons are organized into two sections:

Building a Song: Lessons 1–7

In this section, you'll learn the fundamentals of building a song. Lesson 1 starts you out with an overview of the entire process. You'll get familiar with the interface and the various ways to navigate a project while building a song from scratch using Apple Loops, and then arranging, mixing, and exporting the song to an MP3 file.

In each of the following lessons, you'll focus on a single topic in detail. You'll start by learning how to come up with the building blocks of your musical project: recording, editing, and programming both audio and MIDI files. Finally, you'll manipulate the project tempo, stretch audio files, and apply time and pitch effects.

Arranging and Mixing: Lessons 8–11

In Lessons 8–10, you'll arrange and mix audio and MIDI files into a final project: adding and deleting sections, muting elements, eliminating noise, adjusting levels, panning, EQing, adding reverb, and automating the mix. You'll also learn how to use hardware control surfaces to manipulate various parameters.

Lesson 11 concludes your exploration of Logic by describing useful troubleshooting techniques that can improve your Logic system's reliability and efficiency. You'll learn

effective backup procedures, how to resolve audio and MIDI routing problems, and ways to optimize your hardware. Appendix A covers how to use external MIDI devices, and Appendix B lists a wealth of useful keyboard shortcuts.

Using the DVD Book Files

The *Apple Pro Training Series: Logic Pro 9 and Logic Express 9* DVD (included with the book) contains the project files you will use for each lesson, as well as media files that contain the audio and video content you will need for each exercise. After you transfer the files to your hard disk, each lesson will instruct you in the use of the project and media files.

Installing Logic

The exercises in this book require that you install Logic Studio or Logic Express along with the default content pre-selected in the installer. To install Logic Studio or Logic Express, insert the first installation DVD in your computer, double-click the installer, and follow the installer's instructions to complete the installation.

NOTE ► If you have already installed Logic Studio but did not install some of the content, you can run the installer again and choose to install only the Logic Studio Content.

Using Default Preferences and the U.S. Key Command Preset

All the instructions and descriptions in this book assume that you are using the default set of preferences (unless instructed to change them) and the U.S. key command preset. If you have changed some of your preferences or have not selected the factory U.S. key command preset, you may not get the same results described in the exercises. To make sure you can follow along with this book, it's best to revert to the initial set of Logic preferences and choose the U.S. shortcut preset before you start the lessons. Keep in mind that when you initialize your preferences, you will lose your custom settings, and later you may want to reset your favorite preferences manually.

- 1 From the main menu bar, choose Logic Pro > Preferences > Initialize All Except Key Commands.

A confirmation message pops up.

LOGIC EXPRESS ► When instructed to choose an item from the Logic Pro menu, choose the same item from the Logic Express menu.

2 Click Initialize.

Your preferences are initialized. To choose your key commands preset, you need to open the Key Commands window.

3 In the main menu bar, choose Logic Pro > Preferences > Key Commands.

The Key Commands window opens.

4 Click the Options pop-up menu and choose Presets > U.S.

5 Close the Key Commands window.

Screen Resolution

If you are using a small screen resolution, some of the project files may appear different on your screen than they do in the book. When you open a project, if you can't see the whole Arrange window, move the window until you can see the three window controls at the left of the title bar, and click the zoom button (the third button from the left) to make the window fit the screen.

When using a small screen resolution, you may also have to zoom or scroll more often than instructed in the book to perform some of the exercise steps. In some cases, you may have to temporarily resize or close an area of the Arrange window to perform an action in another area.

Installing the Logic Lesson Files

On the DVD, you'll find a folder titled Logic 9 Files, which contains three subfolders: Lessons, Media, and Apple Loops for Logic Express Users. The first two folders contain the lessons and media files for this course. (See the section "Instruction for Logic Express Users" for an explanation of the third folder.) Make sure you keep these two folders together in the Logic 9 Files folder on your hard disk. If you do so, Logic should be able to maintain the original links between the lessons and media files.

1 Insert the *Logic Pro 9 and Logic Express 9* DVD into your DVD drive.

- 2 Drag the Logic 9 Files folder from the DVD to your desktop to copy it. The Media folder contains about 3 GB of media.
- 3 Wait for the “Copy” Progress indicator to close, and eject the DVD to make sure that you don’t work with the files on the DVD, but with the files you copied on your desktop.

Each lesson will explain which files to open for that lesson’s exercises.

Instructions for Logic Express Users

If you’re using Logic Express 9, most of the instructions in this book are exactly the same as those for Logic Pro 9. When there are differences, you’ll find a note in the exercises addressed specifically to Logic Express users. Keep in mind that Logic Express doesn’t come with the same instruments, effects, and sound library as Logic Studio, and sometimes your screen may look different from the pictures in this book (for example, you may see different settings in the Library, different Apple Loops in the Loop Browser, and different names on tracks and channel strips).

To install files from the *Logic Pro 9 and Logic Express 9* DVD, follow the instructions in the previous section and then install the additional Apple Loops as explained in the steps below.

LOGIC EXPRESS ► The additional Apple Loops for Logic Express Users were taken from the Remix Tools, Rhythm Section, and World Music Jam Packs, which come standard with Logic Studio. The loop Trip Hop Jungle Beat 01 was modified to use a GarageBand instrument available to Logic Express users and sounds different from the original Trip Hop Jungle Beat 01 included in the Remix Tools Jam Pack.

- 1 Open Logic Express.

The Templates dialog opens (if you have used Logic Express before, and a Logic project automatically opens, skip to step 4).

- 2 Click the Empty Project template.

An empty template opens, and a New Tracks dialog comes down from the Arrange window’s title bar. Don’t worry about the settings in that dialog; you just need to create at least one track (of any kind) to continue.

- 3 In the New Tracks dialog, click Create.

The dialog disappears and a track is created.

- 4 From the main menu bar, choose Window > Loop Browser.

The Loop Browser opens.

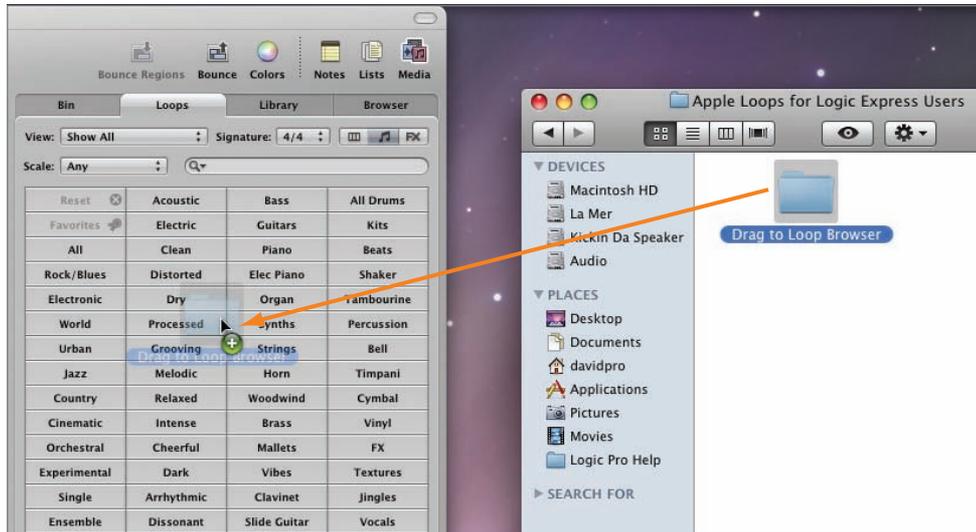

- 5 Close the main Arrange window underneath, and keep only the Loop Browser open so that you can see your desktop.

You may need to move the Loop Browser aside to see the Logic 9 Files folder on your desktop.

- 6 Double-click the Logic 9 Files folder on your desktop, and double-click Apple Loops for Logic Express Users.

You should see a folder named “Drag to Loop Browser.”

- 7 Drag the folder “Drag to Loop Browser” onto the Loop Browser window.

A green + (plus) sign appears at the mouse pointer, indicating that you can release the mouse button to install the Apple Loops.

- 8 In the “Adding Loops to the Loop Browser” dialog, click “Move to Loops Folder” to install the Apple Loops.

System Requirements

Before using *Apple Pro Training Series: Logic Pro 8 and Logic Express 9*, you should have a working knowledge of your Macintosh and the Mac OS X operating system. Make sure that you know how to use the mouse and standard menus and commands, and also how to open, save, and close files. If you need to review these techniques, see the printed or online documentation included with your system.

- ▶ Mac computer with an Intel processor
 - 1 GB of RAM (2 GB or more highly recommended)
 - Display with 1280 x 800 or higher resolution
 - Mac OS X v10.5.7 or later
 - QuickTime 7.6 or later
 - DVD drive for installation
- ▶ USB musical keyboard (or suitable MIDI keyboard and interface) to play software instruments
- ▶ Low-latency multi-I/O audio interface highly recommended for audio recording

About the Apple Pro Training Series

Apple Pro Training Series: Logic Pro 9 and Logic Express 9 is both a self-paced learning tool and the official curriculum of the Apple Pro Training and Certification Program. Developed by experts in the field and certified by Apple, the series is used by Apple Authorized Training Centers worldwide and offers complete training in all Apple Pro products. The lessons are designed to let you learn at your own pace. Each lesson concludes with review questions and answers summarizing what you’ve learned, which can be used to help you prepare for the Apple Pro Certification Exam.

For a complete list of Apple Pro Training Series books, see the ad at the back of this book or visit www.peachpit.com/apts.

Apple Pro Certification Program

The Apple Pro Training and Certification Program is designed to keep you at the forefront of Apple's digital media technology while giving you a competitive edge in today's ever-changing job market. Whether you're an editor, graphic designer, sound designer, special-effects artist, or teacher, these training tools are meant to help you expand your skills.

Upon completing the course material in this book, you can become a certified Apple Pro by taking the certification exam at an Apple Authorized Training Center. Successful certification as an Apple Pro gives you official recognition of your knowledge of Apple's professional applications while allowing you to market yourself to employers and clients as a skilled, pro-level user of Apple products.

For those who prefer to learn in an instructor-led setting, Apple offers training courses at Apple Authorized Training Centers worldwide. These courses, which use the Apple Pro Training Series books as their curriculum, are taught by Apple Certified Trainers and balance concepts and lectures with hands-on labs and exercises. Apple Authorized Training Centers have been carefully selected and have met Apple's highest standards in all areas, including facilities, instructors, course delivery, and infrastructure. The goal of the program is to offer Apple customers, from beginners to the most seasoned professionals, the highest-quality training experience.

For more information, please see the ad at the back of this book, or to find an Authorized Training Center near you, go to training.apple.com.

Resources

Apple Pro Training Series: Logic Pro 9 and Logic Express 9 is not intended as a comprehensive reference manual, nor does it replace the documentation that comes with the application. For comprehensive information about program features, refer to these resources:

- ▶ The *Logic Pro 9 User Manual* and the *Logic Express 9 User Manual*. Accessed through the Logic Help menu, the *User Manual* contains a complete description of all features. The other documents available in the Logic Help menu can be valuable resources as well.
- ▶ Apple's website: www.apple.com.
- ▶ Logic Pro Help's website, an online community of Logic users moderated by the author of this book, David Nahmani: www.logicprohelp.com.

Lesson Files

Time

Goals

Logic 9 Files > Lessons > 04 Rock Song

This lesson takes approximately 60 minutes to complete.

Record MIDI performances

Quantize MIDI recordings

Merge a MIDI recording with an existing MIDI region

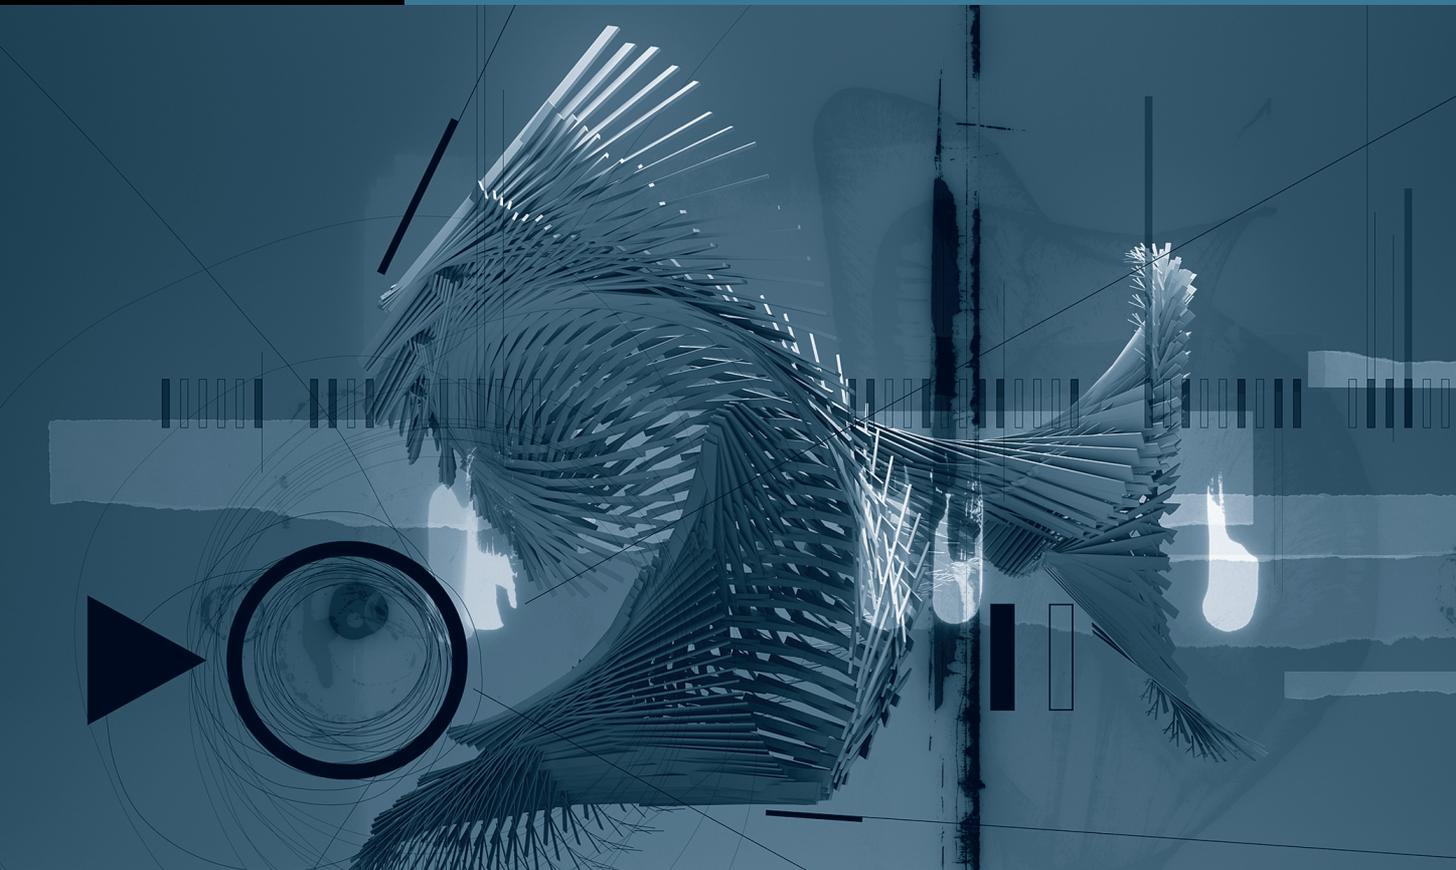

Record MIDI in take folders

Punch record a MIDI recording

Capture a performance as a recording

Record MIDI using Step Input mode

Filter incoming MIDI events

Lesson 4

Recording MIDI

MIDI (the Musical Instrument Digital Interface) was created in 1983 to standardize the way electronic musical instruments communicate. Today, MIDI is extensively used in the music industry, from cell phone ringtones to major-label albums. Most TV and film orchestra composers use MIDI to sequence large software sound libraries, getting ever closer to productions that sound like a real orchestra.

MIDI sequences can be compared to piano rolls, the perforated paper rolls once used by mechanical player pianos. Like the punched holes in piano rolls, MIDI events do not contain audio. They contain note information such as pitch and velocity. To produce sound, MIDI events need to be routed to a software instrument or to an external MIDI instrument.

There are two basic types of MIDI events: MIDI note events that trigger musical notes, and MIDI continuous controller (MIDI CC) events that control parameters such as volume, pan, or pitch bend.

For example, when you hit C3 on a MIDI controller keyboard, the keyboard sends a Note On MIDI event. The Note On event contains the pitch of the note (C3) and the velocity of the note (which indicates how fast the key was struck, measuring how hard the musician played the note).

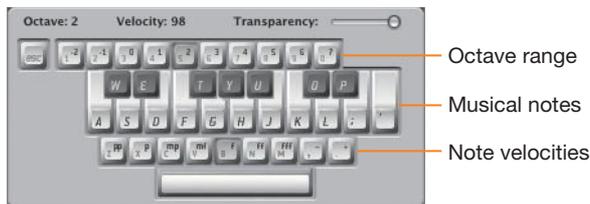

By connecting the MIDI controller keyboard to Logic, you can use Logic to route the MIDI events to a virtual software instrument or to an external MIDI instrument. The instrument reacts to the Note On event by producing a C3 note, and the velocity typically determines how loud the note sounds.

MORE INFO ► To learn more about the MIDI standard specification, visit the MIDI Manufacturers Association website at <http://www.midi.org/>.

Recording MIDI

In Logic, the techniques used to record MIDI are very similar to the techniques you used to record audio in Lesson 2. When a MIDI controller keyboard is connected to your computer, and its driver is properly installed (some devices are class-compliant and don't require a driver installation), you can use that keyboard to record MIDI in Logic. Logic automatically routes all incoming MIDI events to the record-enabled software instrument or external MIDI track.

TIP ► If you don't have a MIDI controller keyboard, press the Caps Lock key on your computer keyboard to turn your Mac keyboard into a polyphonic MIDI controller keyboard. A representation of your computer keyboard is displayed, showing the letter keys assigned to musical notes. The number keys allow you to choose the octave range, and the lower row of keys lets you choose the note velocities. Keep in mind that you may need to disable the Caps Lock keyboard to access some of Logic's key commands. Press the Caps Lock key again to disable the Caps Lock keyboard.

To record a MIDI performance triggering a software instrument, you need to create a software instrument track, insert an instrument plug-in or choose a channel strip setting from the Library, and click Record.

- 1 Go to Logic 9 Files > Lessons and open the **04 Rock Song** project.

That project has a single audio track with a drum loop, which will provide a timing reference to record your new instrument.

- 2 At the top of the track list, click the New Tracks button (+) (or press Command-Option-N).

The New Tracks dialog appears.

- 3 Make sure that Number is set to 1, Type is set to Software Instrument, and Open Library is selected. Then, click Create.

A software instrument track is created, and it is automatically record-enabled. The Library opens, displaying software instrument channel strip settings.

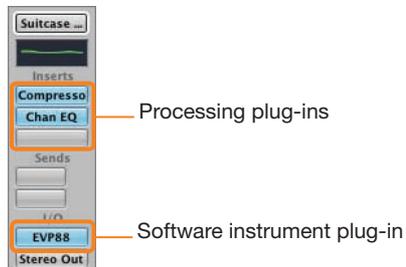

By default, audio tracks have a blue icon and audio regions are blue. Software instruments have a green icon and MIDI regions are green.

- 4 Choose a channel strip setting from the Library.

For this exercise, choose 05 Keyboards > 01 Electric Piano > Suitcase V2.

LOGIC EXPRESS ► For this exercise, choose 05 Keyboards > 01 Electric Pianos > Tines Electric Piano, and in the following exercises, substitute Tines Electric Piano when you see Suitcase V2.

In the Inspector, the software instrument channel strip loads the necessary plug-ins. In the Arrange area, the name *Suitcase V2* is displayed on the Inst 1 track header.

While audio channel strip settings contain only processing plug-ins, software instrument channel strip settings also contain the software instrument plug-in. On the channel strip, the software instrument plug-in is loaded in the Instrument slot of the I/O section.

- 5 Play some notes on your MIDI controller keyboard.

You should hear the electric piano. In the Transport bar's MIDI In display, the incoming MIDI note events are displayed as notes are played. If you play a chord, the display shows the chord name.

You are now ready to record, but first open the Piano Roll Editor so that you can see the MIDI notes appear as you record them.

- 6 At the bottom of the Arrange area, click the Piano Roll button (or press P).

The Piano Roll Editor opens in the editing area.

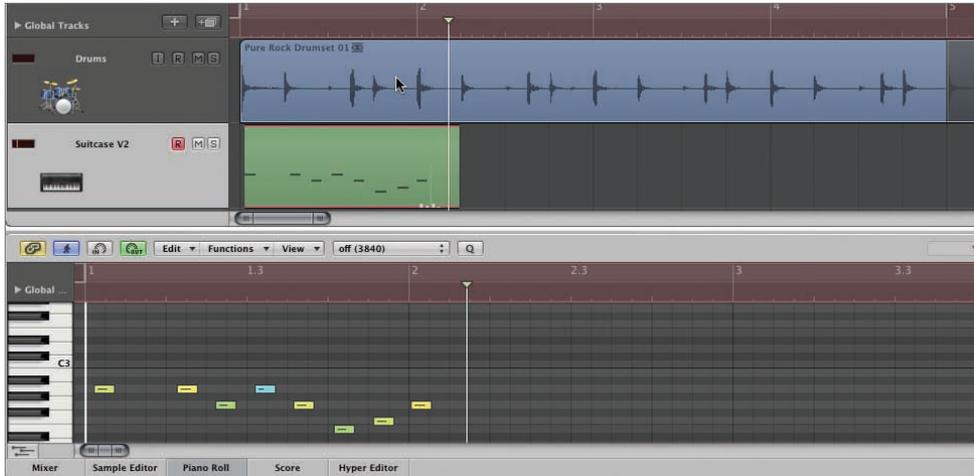

- 7 Go to the beginning of the project.

- 8 In the Transport bar, click the Record button (or press R).

The playhead jumps back one bar, giving you a four-beat count-in with an audible metronome click before recording starts. The Bar ruler turns red to indicate that Logic is recording.

- 9 When you can see the playhead, play some notes.

Play a simple bass line in an eighth-note pattern. You will record more notes in that region later in this lesson.

When you play the first MIDI note, a new MIDI region with a red halo is created on the record-enabled Suitcase V2 track. The region's length constantly updates to include the most recent MIDI event played.

The MIDI notes appear in the Piano Roll Editor as you record them.

- 10 Stop recording.

MIDI notes

In the MIDI region, the notes are displayed as small beams.

- 11 Go back to the beginning and listen to your MIDI recording.

If you are not happy with your performance, you can undo it (Command-Z) and try again.

TIP If you record-enable several software instrument tracks, incoming MIDI events will be routed to all record-enabled tracks, allowing you to layer the sounds of several instruments.

Quantizing MIDI Recordings

If you are not happy with the timing of your MIDI performance, you can correct the timing of the notes. The time-correction process is called *quantization*. To quantize a MIDI region, you choose a grid resolution from the Quantize menu in the Region Parameter box. Each note inside the region will snap to the nearest position on the chosen grid.

Quantizing MIDI Regions

In the following exercise, you will quantize the recording you made in the previous exercise to correct its timing, so that the piano notes are in sync with the drums.

- 1 Make sure the new #default MIDI region is selected.

First, you'll rename the region so that you can easily identify it later.

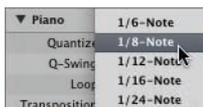

- 2 In the Inspector's Region Parameter box, double-click the name of the region and enter *Piano*.

The region is renamed *Piano*.

Now choose the Quantize value, which determines the resolution of the grid used to quantize the notes.

- 3 Set the Quantize parameter to 1/8-Note while looking at the notes in the Piano Roll Editor.

All the MIDI notes snap to the nearest eighth note.

- 4 Go to the beginning and start playback.

You can hear your performance, perfectly in time with the drums. Unless of course the performance timing was really poor, in which case some of the notes may not snap to the desired 1/8 note.

In Logic, quantizing is a nondestructive operation. You can always go back to the way the performance was originally recorded.

- 5 With the Piano region selected, open the Quantize parameter menu and choose “off (3840).”

The MIDI notes return to their original recording positions.

MORE INFO ► The (3840) indicator identifies the shortest resolution of Logic’s MIDI sequencer, the tick. When the time signature is 4/4, there are 3840 ticks in a bar (or 240 ticks in a sixteenth note). When Quantize is set to “off (3840),” the notes snap to the closest tick.

- 6 From the Quantize parameter menu, choose 1/8-Note again.

The notes snap back to the grid.

MORE INFO ► The Quantize menu also offers Swing settings. The Swing settings delay the position of every other note in the grid to obtain a swing, or shuffle groove, common in many music genres such as blues, jazz, hip-hop, and house music. The amount of delay goes from no delay (A = no swing) to a lot of delay (F = hard swing). For example, 8B Swing will subtly delay the second eighth note of each beat.

Setting a Default Quantization Grid

You can set a default quantization value so that any new recording will automatically be quantized to that grid resolution. This is very useful if you are not confident of your timing chops. Since the Quantize setting is nondestructive, you can always adjust it or turn it off for that region after the recording is done.

- 1 Click in the background of the Arrange area.

All regions are deselected, and the Region Parameter box now displays the MIDI Thru settings. The MIDI Thru parameter settings are automatically applied to any new MIDI region that you record.

- 2 Set the Quantize parameter to 1/16-Note.

- 3 Select the Piano region.

The Region Parameter box displays the region's name and settings. You can see the Quantize setting you applied to that region in the previous exercise: 1/8-Note.

- 4 Press Delete.

The region is deleted.

- 5 Go to the beginning of the track and click the Record button (or press R).

Record a new simple bass line as you did previously.

- 6 Stop recording.

In the Piano Roll Editor, the notes immediately snap to the nearest 1/16 note. The new MIDI region is selected, and the Region Parameter box now displays its parameters: Quantize is automatically set to 1/16-Note, the MIDI Thru Quantize setting you set in step 2.

- 7 Set the Quantize parameter to “off (3840).”

The notes return to their original recorded positions.

- 8 Set the Quantize parameter back to 1/16-Note.

Merging Recordings into a MIDI Region

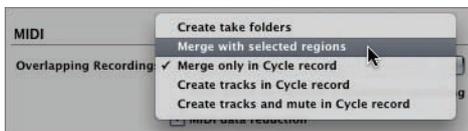

Sometimes you may want to record a MIDI performance in several passes. For example, when recording piano, you can record only the left hand and then record the right hand in a second pass. Or, when recording drums, you can record the kick drum in the first pass, the snare in a second pass, and the hi-hat in a third pass.

In Logic, when recording MIDI events on top of an existing MIDI region, you can choose to merge the new events with the existing ones.

Recording into a Selected MIDI Region

In the previous exercise, you recorded a simple bass line onto a piano track. Now you will play chords as you listen to the bass line and record the new chords inside the same MIDI region. First, you will choose the correct recording setting to merge your new recording with the selected region.

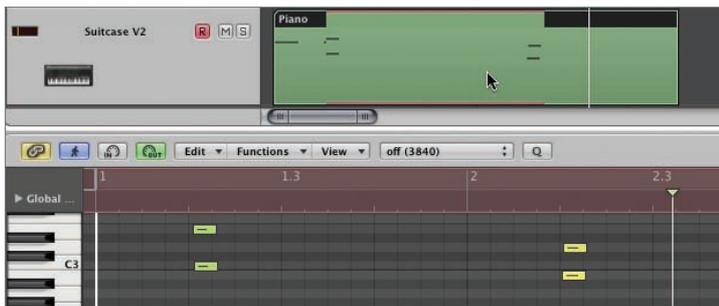

- 1 In the Toolbar, click the Settings button and choose Recording.
- 2 Under MIDI, set Overlapping Recordings to “Merge with selected regions.”

Now you only have to select the existing MIDI region before recording, and the new notes will be recorded inside the selected region.

- 3 Make sure the Piano region is still selected.
- 4 Go to the beginning and start recording.

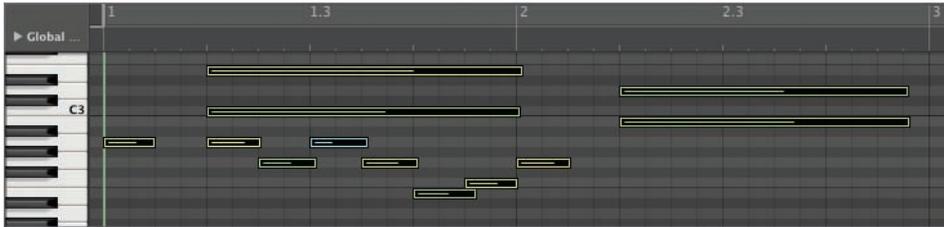

Try to play some chords that complement the bass line you recorded previously.

NOTE ► While you are recording, you are temporarily recording a new region on top of the existing one. The new region will be merged with the existing one as soon as you stop recording. The Piano Roll Editor displays the contents of the new region you are recording, and although the contents of the existing region are not displayed while you are recording, you can still hear the existing notes played back.

5 Stop recording.

The new recording is merged with the existing region and you can see all the notes in the Piano Roll Editor. (You might have to scroll or resize the Piano Roll Editor window to see all the notes.) Note that the notes you just recorded snap to the nearest 1/16 note, the default quantize resolution you chose in the previous exercise.

TIP You can also use this technique to add MIDI Controller events such as pitch bend or modulation to a region after you have recorded the MIDI notes.

Merging Recordings in Cycle Mode

Recording in Cycle mode allows you to continuously repeat the same section and only record new events when you are ready. This can be very useful when recording a drum pattern, for example. When repeating a one-bar or two-bar section, you can add new elements to the pattern during each pass of the cycle, while listening to everything that you have recorded.

When you are recording in Cycle mode, notes recorded in all consecutive passes of the cycle are merged into a single MIDI region. In this exercise, you will use Cycle mode to record drums—first recording the kick, then the snare, then the hi-hat.

1 In the Arrange area, mute both existing tracks.

Remember that you can click the Mute button on the first track header and drag down the mouse to mute both tracks.

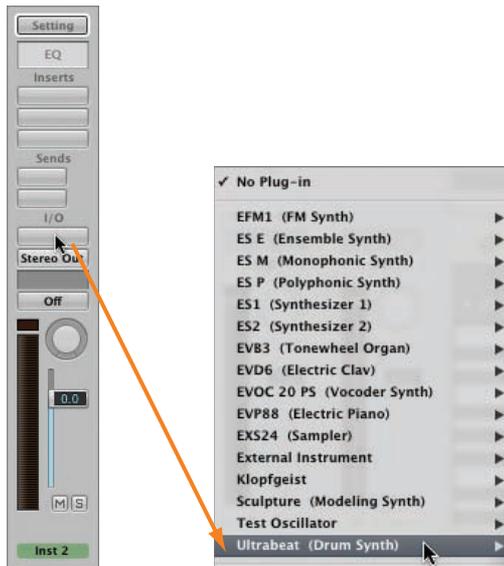

- 2 At the top of the track list, click the New Tracks button (+) (or press Command-Option-N).

The New Tracks dialog appears.

- 3 Make sure that Number is set to 1, Type is set to Software Instrument, and Open Library is selected. Then, click Create.

This time, you will insert the software instrument in the Inspector, on the Arrange channel strip.

- 4 In the I/O section of the channel strip, click the Instrument slot.

A menu appears, allowing you to choose one of Logic's software instruments.

- 5 Choose Ultrabeat (Drum Synth).

NOTE ► When you place your pointer over Ultrabeat (Drum Synth), a menu opens on the right that allows you to choose between Stereo and Multi-Outputs. For now, do not use the lower-level menu, and simply choose Ultrabeat (Drum Synth). By default, a stereo Ultrabeat will be inserted.

The Ultrabeat plug-in is inserted in the Instrument slot of the channel strip, and the Ultrabeat plug-in window opens.

- 6 Close the Ultrabeat window.

MORE INFO ► For now, you will use Ultrabeat to produce drum sounds as you record MIDI in Cycle mode. In Lesson 6, “Programming Drums,” you will use the Ultrabeat interface to program a drum pattern.

Notice the white frame around the Ultrabeat plug-in on the channel strip. A white frame indicates the selected section of the channel strip, whose settings are automatically displayed in the Library. The Library now displays Ultrabeat settings.

- 7 In the Library, choose 01 Drum Kits > Funk Boogie Kit.

Wait a few seconds while Ultrabeat loads the kit. When the kit is fully loaded, the drum kit name is displayed on the track 3 track header in the Arrange area.

Selecting a software instrument track automatically record-enables it, but the instrument is not always in live mode. (An instrument in live mode requires more CPU resources) When an instrument is not in live mode, the first note you play will take about 100 ms (milliseconds) to trigger the instrument, which is then placed in live mode.

You can put an instrument in live mode by sending any MIDI event to it (playing a dummy note, moving the modulation wheel, and so on) or by clicking the Record Enable button in its track header.

Record-enabled instrument not in live mode

Record-enabled instrument in live mode

First, locate the notes on your controller keyboard that trigger the kick, the snare, and the hi-hat. In Ultrabeat, you will use the following:

- ▶ C1: kick
- ▶ E1: snare
- ▶ F#1: hi-hat

- 8 Play the lowest C note on your MIDI controller while watching the MIDI Activity display in the Transport bar.

If the MIDI In display doesn't show a C1, press your MIDI controller keyboard Octave Up and Down buttons until the lowest C plays a C1.

NOTE ▶ If your MIDI keyboard has a C lower than C1, locate the C1 on a higher octave.

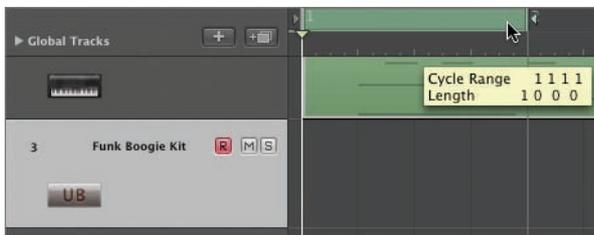

MORE INFO ▶ If you are using the Caps Lock keyboard, press 4 to set the right octave, and press A to trigger a C1 MIDI note.

When you can trigger a kick with C1, locate E1 (two white notes to the right) to play the snare and F#1 (the next black note to the right) to play the hi-hat.

- 9 In the Bar ruler, click the cycle area.

Cycle mode turns on, and the cycle area is shown as green.

- 10 Resize the cycle area so that it spans one bar starting at the beginning of the song.

You will now record the drums, one at a time.

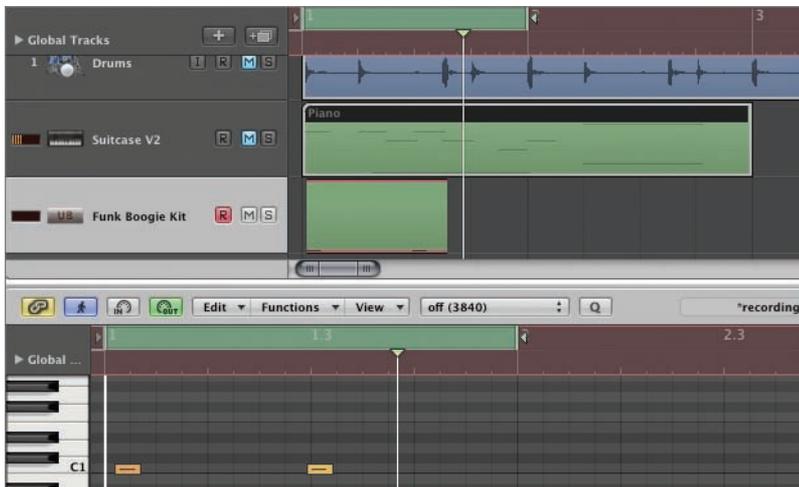

- 11 Click in the background of the Arrange area.

The Region Parameter box displays the MIDI Thru parameters.

- 12 Set the Quantize parameter to 1/8-Note.

- 13 Start recording.

You hear a four-beat count-in before the playhead reaches the beginning of the cycle area. Play two C1 notes: one on the first beat, one on the third beat. In the Piano Roll Editor's Bar ruler, the first beat is on 1, the third beat on 1.3 (bar 1, beat 3).

When a new cycle begins, you can hear the kick drum notes you just recorded. Notice that the notes snap to the nearest 1/8 note because you chose that grid resolution for your default MIDI Thru parameters.

You have all the time in the world before you continue to record. As long as you don't play anything, there are no MIDI events, and Logic keeps cycling over the existing region, playing back your kick drums. If you feel the need to practice the snare before recording, you can return to play mode while cycling continues.

- 14** Click the Play button (or press Shift-Return).

Logic is no longer in record mode (and the metronome stops clicking), but playback continues as Logic repeats the cycle area without interruption. Notice that the two C1 notes are now quantized to the grid.

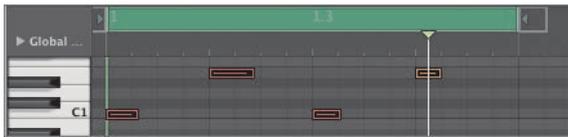

On your MIDI keyboard, locate the snare (E1) and practice a snare pattern. Try to hit the snare on beats 2 and 4.

- 15** Click the Record button.

Playback continues without interruption, but Logic reenters record mode.

- 16** Click your drum region on track 3 to select it. When you feel ready, record the snare.

When the playhead jumps to the beginning of the cycle, you can see the two kick notes and the two snare notes in the Piano Roll Editor.

Use the same techniques to record your hi-hat (F#1) on every eighth note in the same MIDI region.

- 17** Stop recording.

The merge MIDI-recording techniques you used in the two previous exercises provide a lot of flexibility and allow you to take your time, recording a single part of a performance. These techniques will work in many situations. For example, consider recording a violin or cello on a software instrument track; then, on a second pass, record the movements of the pitch bend wheel to add vibrato to some of the notes.

Recording MIDI Takes

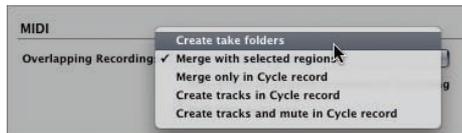

When you want to nail a performance or experiment with various musical ideas, you can record different takes and later choose the best one. The techniques to record MIDI takes are similar to the techniques you used to record audio takes in Lesson 2. You can record over an existing MIDI region, or you can use cycle recording to record one take for each pass of the cycle.

Cycle mode should still be turned on from the previous exercise. Let's record takes in Cycle mode and experiment using different melodies for a bass line.

- 1 In the Transport bar, hold down the Record button and choose Recording Settings from the pop-up menu.

The Recording Project Settings window opens.

- 2 In the MIDI area, from the Overlapping Recordings pop-up menu, choose "Create take folders."

- 3 Close the Project Settings window.
- 4 In the Arrange area, unmute track 1 (Drums/Audio 1) and mute track 3 (Funk Boogie Kit/Inst 2).
- 5 Create a new software instrument track and open the Library.
- 6 In the Library, choose 03 Bass > 02 Electric Bass > Aggressive Fretless.

LOGIC EXPRESS ► Choose 03 Bass > 02 Electric Bass > Rock Fretless, and in the following steps, use Rock Fretless instead of Attitude Bass.

- 7 Start recording and play a different melody for each pass of the cycle until you have three or four takes.

A MIDI take is recorded for each pass of the cycle where you play MIDI notes. If you don't play anything for a whole cycle, no take is recorded. The takes are packed into a take folder.

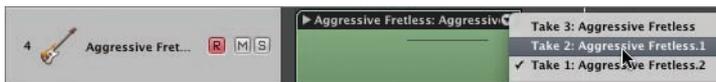

When a new cycle begins, the take you just recorded is automatically muted. You can listen to it by switching to play mode.

- 8 Click the Play button (or press Shift-Return).

You are now in play mode, and you can hear the last take you recorded.

- 9 Open the take folder menu and choose the take you want to hear.

You can also double-click the take folder to open it and click the take you want to hear. Double-click the take folder to close it.

MORE INFO ▶ Unlike audio take folders, you cannot comp the takes in a MIDI take folder.

- 10 Stop playback and turn off Cycle mode.

Using Punch Recording

You can use the punch-on-the-fly and autopunch techniques you learned for audio recording to punch on MIDI recordings. The only difference is that you'll have to turn on the Replace mode.

In the next exercise, you will record a piano performance, and then use both the Replace and Autopunch modes to rerecord a section of the performance.

- 1 Mute the Aggressive Fretless track.
- 2 Select and unmute the Suitcase V2 track.

The track is record-enabled, and the MIDI region on the track is selected. If you have several MIDI regions on that track, all the regions are selected.

NOTE ▶ Make sure that Cycle mode is turned off. If Cycle mode is turned on, selecting a track selects only those regions within the cycle area (and the regions that overlap the cycle area).

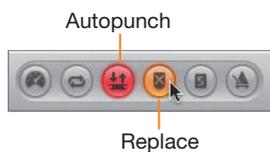

- 3 Press Delete.

All the selected MIDI regions are deleted.

- 4 Press Record, play your keyboard for four or five bars, and stop the recording.

You will now correct a bar of your performance.

- 5 Click both the Autopunch and Replace buttons.

In order to merge the new events you are going to record over the Autopunch area with the existing region on the track, you need to change your recording settings back to the default settings.

- 6 In the Transport bar, hold down the Record button and choose Recording Settings from the pop-up menu.

The Recording Project Settings window opens.

- 7 In the MIDI area, from the Overlapping Recordings pop-up menu, choose “Merge only in Cycle record.”
- 8 In the Bar ruler, adjust the Autopunch area around a section of the Piano that you want to record over.

Make sure the Autopunch area is placed over a section of the piano performance you captured in the previous exercise.

- 9 Go to the beginning of the project and make sure the Suitcase V2 track is still record-enabled.
- 10 Click the Record button and start playing right away.

On the Piano track, the section below the Autopunch area is deleted.

Notes are deleted.

You can hear the notes you are playing over the previous recording, but only the notes played within the Autopunch area are recorded inside the MIDI region.

- 11 Turn off the Autopunch and Replace modes.

Using Step Input Recording

Instead of recording a real-time performance, you can record notes one at a time. In Step Input mode, you position the playhead and play a note or chord on your MIDI keyboard. The note(s) are recorded, and the playhead moves one step ahead, waiting for the next note(s).

This mode is very useful for recording complex musical phrases that you can't perform in real time, such as complicated chord patterns or really fast arpeggios (a great technique for dance music).

- 1 Select the Suitcase V2 track and press Delete.

All the regions on the track are deleted.

TIP If you don't want to select the regions on a track when selecting the track, hold down Option as you select the track.

You start by creating an empty MIDI region using the Pencil tool (as the Command-click tool). You will step-record notes inside that new region.

- 2 Press Esc and Command-click the Pencil tool.
- 3 Command-click the Suitcase V2 track between bars 1 and 2.

The Pencil tool creates an empty one-bar MIDI region.

- 4 Resize the region so that it is four bars long.

- 5 At the upper left of the Piano Roll Editor, click the MIDI In button.

The button turns red and MIDI Step Input Recording is turned on.

MORE INFO ▶ You can also enable Step Input Recording in the Score Editor or the Event List.

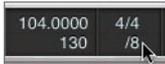

- 6 Go to the beginning of the project.
- 7 Play a single note on your MIDI keyboard.

A 1/16 note is recorded at the playhead position, and the playhead moves forward one 1/16 note. The recorded note has the pitch and velocity of the note you played.

The length of a step is identified by the division setting in the Transport bar, below the time signature.

- 8 In the Transport bar, click the division setting and drag down until it reads /8.

In the Piano Roll Editor, the grid resolution is the same as the division setting. The vertical grid lines are now placed at eighth-note intervals.

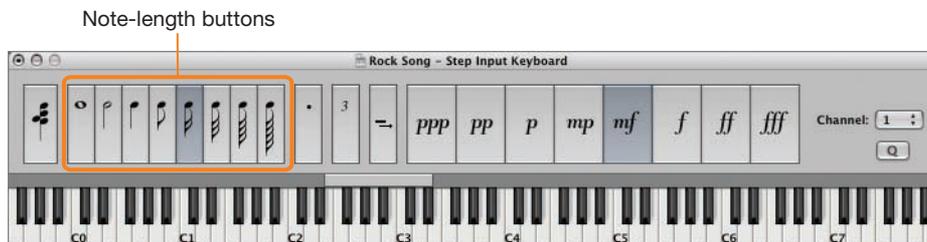

- 9 Play a chord.

An eighth-note chord is recorded at the playhead position, and the playhead moves forward one eighth note.

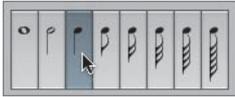

You can also use the Step Input Keyboard to exercise more control over your step input recordings.

- 10 From the main menu bar, choose Options > Step Input Keyboard.

The floating Step Input Keyboard appears. The selected note-length button overrides the division setting in the Transport bar.

- 11 On the Step Input Keyboard, click the quarter-note button.

- 12 Play a note.

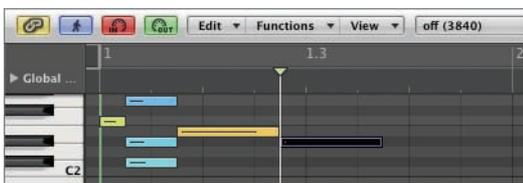

A quarter note is recorded at the playhead position, and the playhead moves forward one quarter note.

If you were recording a quarter-note pattern and wanted to record a single half note, you could click the half-note button, record your half note, and click the quarter-note button again to record the next quarter note.

An easier way is to use the Sustain Insert Note button.

- 13 Play a note and hold down the key on your MIDI keyboard.

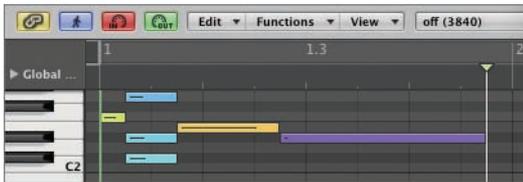

A quarter note is recorded. You need to hold down the MIDI key for the next step, so that the note you are recording remains selected in the Piano Roll Editor.

TIP You can also release the key on your MIDI keyboard and click the inserted note to select it.

- 14** On the Step Input Keyboard, click the Sustain Inserted Notes button.

The selected note is lengthened by a quarter note, so it is now a half note. You can click the Sustain Inserted Notes button several times to lengthen the selected notes by the current step length. You can now release the key on your MIDI keyboard.

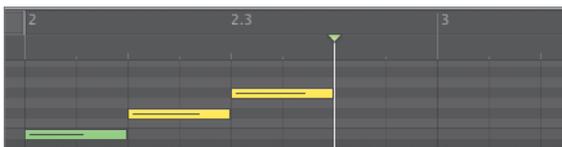

Now let's record quarter notes starting on bar 2.

- 15** With the pointer positioned over the lower half of the Piano Roll Bar ruler on bar 2, hold down the mouse button.

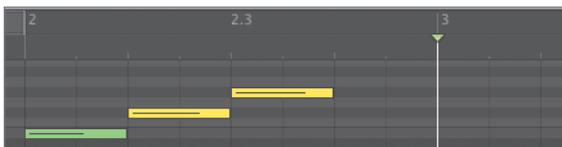

The playhead snaps to bar 2.

- 16** Play three notes, one at a time.

Now you want to insert a quarter-note rest.

- 17** On the Step Input Keyboard, click the Sustain Inserted Notes button.

The playhead jumps forward one quarter note. When no notes are selected, the Sustain Inserted Notes button makes the playhead move one step ahead, and you can resume step input recording.

Try using step input recording techniques to record fast 1/16-note arpeggios or even crazy chord patterns. With a little experimentation, you will quickly end up with cool musical phrases that couldn't possibly be performed live.

- 18 Click the MIDI In button to turn off Step Input recording, and close the Step Input keyboard window.

Filtering Incoming MIDI Events

Sometimes your MIDI controller keyboard sends MIDI events that you may not want to record in Logic. Maybe you are using a faulty MIDI keyboard that generates random pitch bend events, or your keyboard is sending aftertouch MIDI events when you apply pressure to the keys, but the instrument you are recording does not react to aftertouch.

Logic allows you to filter out undesired incoming MIDI events so that they are not recorded. Since input filter settings are project settings, you can adjust them to filter various types of events in different projects.

- 1 In the Toolbar, click the Settings button and choose MIDI from the pop-up menu.

2 Click the Input Filter tab.

In this tab, you can select the MIDI events you want to filter.

3 In the Arrange area, click the Suitcase V2 track header.

The track is selected and record-enabled.

4 Play some notes on your MIDI controller keyboard and move the pitch bend wheel.

You can hear the note pitches change as you move the pitch bend wheel.

5 In the MIDI Project Settings window's Input Filter tab, select Pitch Bend.

6 Play some notes on your MIDI controller keyboard and move the pitch bend wheel.

This time the pitch bend MIDI events are filtered at their input into Logic, and your pitch bend wheel movements have no effect on the pitch of the notes you play.

Separating the MIDI data from the audio signal produced by the instrument allows for very flexible recording. Throughout this lesson you quantized your notes to a grid and chose to merge new recordings into an existing MIDI region or to record separate takes in a MIDI take folder. You also used step input recording to enter notes one step at a time, without the pressure of recording a real-time performance.

After a MIDI performance is recorded, you can still change the sound of the instrument independently of the MIDI events, or edit the MIDI events independently of the instrument's sound. Those vast sound- and performance-editing possibilities take you to a new realm of experimentation. Enjoy it!

MORE INFO ► To learn how to use external MIDI instruments with Logic, read the Appendix, “Using External MIDI Devices.”

Lesson Review

1. How does Logic route incoming MIDI events?
2. How can you time-correct a MIDI region?
3. How do you choose the default quantize settings for new MIDI recordings?
4. How do you record MIDI takes?
5. What do you need to do before you can punch in on a MIDI track to replace a portion of a MIDI region?
6. How do you turn on Step Input mode?
7. When recording in Step Input mode, identify two ways you can adjust the step length.

Answers

1. All incoming MIDI events are routed to the record-enabled track(s).
2. In the Inspector’s Region Parameter box, choose a grid resolution value from the Quantize menu. The MIDI notes in the region will snap to the nearest position on the chosen grid.
3. Deselect all regions to choose the MIDI Thru parameters in the Region Parameter box.
4. Open the Recording project settings and choose Overlapping Recordings > Create take folders, and then record on top of an existing record, or record in Cycle mode.
5. You need to turn on the Replace mode.
6. Click the MIDI In button in the Piano Roll Editor, Score Editor, or Event List.
7. In the Transport bar, adjust the division setting; or open the Step Input Keyboard and use the note-length buttons.
