

Configuring Other Email Accounts on an iPod touch Manually

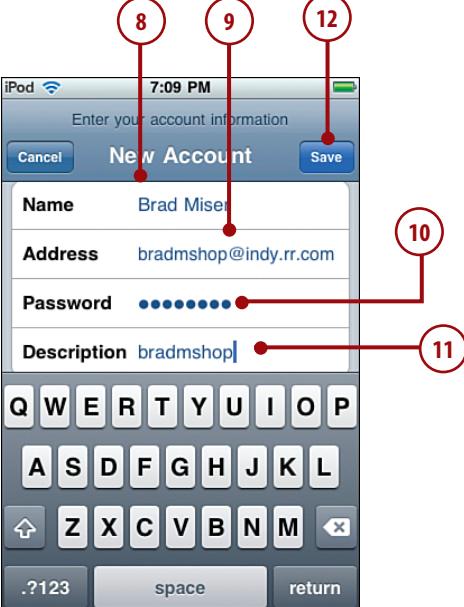

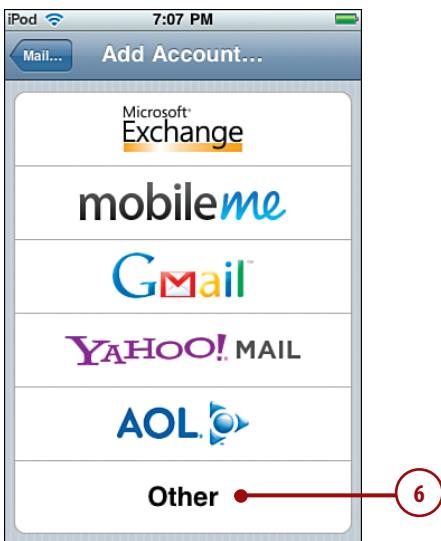

1. Gather the configuration information for your email account, such as its type, your email address, your username, your password, incoming mail server, and outgoing mail server.
2. On an iPod touch's Home screen, tap Settings.
3. Scroll down the screen.
4. Tap Mail, Contacts, Calendars. The Mail, Contacts, Calendars screen appears.
5. Tap Add Account. You see the Add Account screen.

Sync 'Em If You've Got 'Em

If you have an email account already configured on a computer, there's really no need to configure it manually on an iPod touch. It's much easier just to sync the account onto an iPod touch. See Chapter 4, "Configuring and Synchronizing Information on an iPod touch," for the steps to sync email accounts.

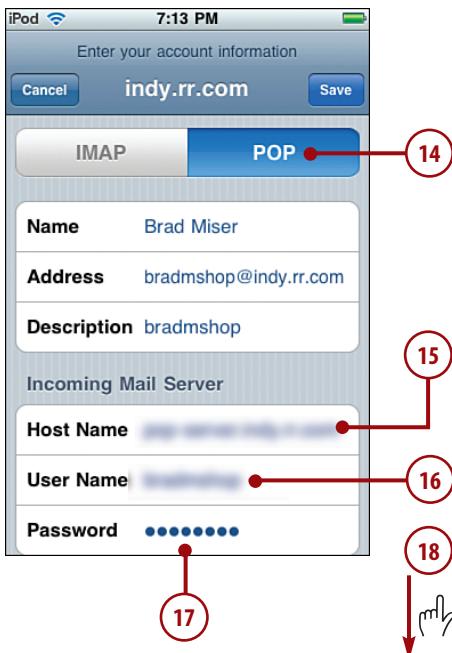

6. Tap Other. You see the Other screen.
7. Tap Add Mail Account.
8. Enter your name.
9. Enter your email address.
10. Enter your email account password.
11. Change the default description, which is your email address, if you want to. This description appears on various lists of accounts.
12. Tap Save. Your account information is verified.
13. If you see an information screen about your account, tap Next; if you don't see such a screen, go to the next step.

My iPod touch

14. Tap POP for a POP account or IMAP for an IMAP account. The rest of these steps are for a POP account, but configuring an IMAP account is similar.
15. In the Incoming Mail Server section, enter the hostname if the default name isn't correct.
16. Enter your email account's username if the default username isn't right.
17. Enter your email account's password; this should be the same password you entered in step 10 so you can skip this step in most cases.
18. Scroll down the screen.
19. Enter the hostname for the outgoing mail server.
20. Enter the username for the outgoing mail server; in most cases, this is the same username as in step 16. If your outgoing mail doesn't require this information or if it doesn't use SSL, skip to step 22.
21. Enter the password for the outgoing mail server; most of the time, this is the same password as in step 10.
22. Tap Save. The account information is verified. If the account is configured correctly, you see the account's information on the Mail, Contacts, Calendars screen and can skip to step 27. If not, review the information you entered in the previous steps and correct any that isn't accurate until the account checks out as being configured correctly.

No SSL?

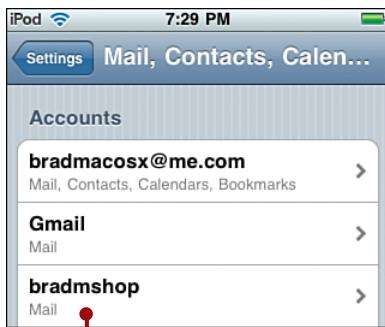

When you see a message about SSL (Secure Sockets Layer, a communication security protocol) not being available, tap No to proceed without SSL. In case you're wondering, SSL is used to encrypt data that is transferred over the Internet. Some email tools can work with SSL connections, while others can't. If you can use it, you should, but if you can't, it's not something to worry about.

23. Tap Yes to clear the prompt. If the process works, you see the account's information on the Mail, Contacts, Calendars screen and can skip to step 27. If the process fails again and you see a warning about the account not supporting authentication, tap OK to clear the prompt and continue to the next step.
24. Delete the hostname and user-name you entered in steps 20 and 21.
25. Tap Save. The account information is checked again. If the configuration is correct, you see the account's information on the Mail, Contacts, Calendars screen and can skip to step 27.
26. If you see the SSL prompt again, tap Yes. You see the account's information on the Mail, Contacts, Calendars screen.

My iPod touch

27. If you want to perform advanced configuration of the account, refer to "Performing Advanced Configuration of Email Accounts on an iPod touch" later in this chapter.

Email account ready to use
