

DON POULTON

Cert Guide

Learn, prepare, and practice for exam success

- ▶ Master every topic on Microsoft's new MCTS 70-642 exam.
- ▶ Assess your knowledge and focus your learning.
- ▶ Get the practical workplace knowledge you need!

	CD-only Elements:	
APPENDIX B	Memory Tables	2
APPENDIX C	Memory Tables Answer Key	2
	Glossary	2

Table of Contents

Introduction 3

Chapter 1 Configuring IPv4 and IPv6 Addressing 27

“Do I Know This Already?” Quiz 28

Concepts of TCP/IP 33

TCP/IP History in Brief 33

TCP/IP Protocol Stack 34

OSI Reference Model 34

Four-Layer TCP/IP Model 35

Application Layer 36

Transport Layer 36

Internet Layer 37

Network Interface Layer 37

TCP/IP Component Protocols 38

Transmission Control Protocol 38

User Datagram Protocol 38

Internet Protocol 39

Address Resolution Protocol 39

Internet Control Message Protocol 39

Internet Group Management Protocol 40

Application Layer Protocols 40

IPv4 Addressing 41

Static IPv4 Addressing 42

Subnetting and Supernetting in IPv4 44

Using Subnetting to Divide a Network 44

Using Supernetting to Provide for Additional Hosts on a Network 47

Understanding Private IPv4 Networks 48

Dynamic IP Addressing 48

Configuring IPv4 Address Options 48

Using the Command Line to Configure IPv4 Addressing Options 52

IPv6 Addressing 54

IPv6 Address Syntax 56

IPv6 Prefixes 56

Types of IPv6 Addresses 56

Connecting to a TCP/IP Version 6 Network	59
Interoperability Between IPv4 and IPv6 Addresses	62
<i>Compatibility Addresses</i>	63
<i>ISATAP Addresses</i>	63
<i>6to4 Addresses</i>	64
<i>Teredo Addresses</i>	65
Using Group Policy to Configure IPv6 Transition Technologies	66
Resolving IPv4 and IPv6 Network Connectivity Issues	67
Windows Server 2008 Network Diagnostics Tools	68
Using TCP/IP Utilities to Troubleshoot TCP/IP	70
<i>ARP</i>	70
<i>FTP</i>	70
ipconfig	71
Nbtstat	72
Netstat	72
Nslookup	73
ping	73
tracert	74
pathping	75
Troubleshooting IPv4 and IPv6 Problems	75
<i>Suggested Response to a Connectivity Problem</i>	75
<i>Network Discovery</i>	76
<i>Incorrect IPv4 Address or Subnet Mask</i>	77
<i>Incorrect Default Gateway</i>	78
<i>Unable to Connect to a DHCP Server</i>	78
<i>Duplicate IP Address</i>	78
<i>Unable to Configure an Alternate TCP/IPv4 Configuration</i>	78
<i>Using Event Viewer to Check Network Problems</i>	79
<i>Additional Troubleshooting Hints When Using IPv6</i>	79
Review All the Key Topics	80
Complete the Tables and Lists from Memory	81
Definition of Key Terms	81
Chapter 2 Configuring Dynamic Host Configuration Protocol (DHCP)	83
“Do I Know This Already?” Quiz	83
How DHCP Works	89

Four-Phase DHCP IPv4 Leasing Process	89	
<i>IP Lease Request (DHCPDISCOVER)</i>	90	
<i>IP Lease Offer (DHCPOFFER)</i>	91	
<i>IP Lease Selection (DHCPREQUEST)</i>	91	
<i>IP Lease Acknowledgment (DHCPACK)</i>	92	
Renewing an IPv4 Lease	92	
How DHCPv6 Works	93	
Installing and Configuring a DHCP Server	95	
Using the Command Line to Install DHCP	100	
DHCP Scopes and Options	101	
Creating DHCP Scopes	101	
<i>Using the Command Line to Create Scopes</i>	104	
<i>Superscopes</i>	104	
<i>Multicast Scopes</i>	105	
<i>Split Scopes</i>	106	
<i>Exclusions</i>	107	
Configuring DHCP Scope Properties	107	
Configuring DHCP Options	108	
<i>Server Options</i>	110	
<i>Scope Options</i>	111	
<i>Option Classes</i>	112	
<i>Client Reservations and Options</i>	114	
Managing and Troubleshooting a DHCP Server	116	
Authorizing a DHCP Server in Active Directory	116	
Configuring DHCP Relay Agents	117	
PXE Boot	120	
Monitoring and Troubleshooting a DHCP Server	121	
Review All the Key Topics	124	
Complete the Tables and Lists from Memory	125	
Definition of Key Terms	125	
Chapter 3	Configuring Routing	127
“Do I Know This Already?” Quiz		127
The Need for Routing and Routing Tables		132

Routing Protocols	133	
Routing Table	135	
Routing and Remote Access Service (RRAS) in Windows Server 2008 R2	137	
Configuring RRAS as a Router	140	
Configuring RIP	142	
Configuring Static Routing	145	
<i>Using the RRAS Snap-In to Create a Static Route</i>	145	
<i>Using the route Command to Create a Static Route</i>	146	
<i>Choosing a Default Gateway</i>	147	
<i>Displaying the Static Routing Table</i>	147	
Managing and Maintaining Routing Servers	148	
Demand-Dial Routing	148	
<i>Establishing a Demand-Dial Interface</i>	148	
<i>Configuring Demand-Dial Interface Properties</i>	150	
Specifying Packet Filtering	151	
IGMP Proxy	153	
Review All the Key Topics	156	
Complete the Tables and Lists from Memory	157	
Definition of Key Terms	157	
Chapter 4	Configuring Windows Firewall with Advanced Security	159
“Do I Know This Already?” Quiz	159	
Configuring Windows Firewall	165	
Basic Windows Firewall Configuration	167	
Using the Windows Firewall with Advanced Security Snap-In	172	
Configuring Multiple Firewall Profiles	174	
Configuring New Firewall Rules	176	
<i>Configuring Inbound Rules or Outbound Rules</i>	176	
<i>Configuring Connection Security Rules</i>	180	
Configuring Rule Properties	184	
<i>Authorizing Users and Computers</i>	185	
<i>Modifying Rule Scope</i>	187	
<i>Additional Rule Properties</i>	188	
Configuring Notifications	189	

Importing and Exporting Policies	190
Using IPSec to Secure Network Communications	191
IPSec Modes	191
IPSec Encryption	193
Using Group Policy to Create IPSec Policies	194
Using Group Policy to Configure Windows Firewall Policies	198
<i>Creating Windows Firewall with Advanced Security Policies</i>	198
<i>Windows Firewall Group Policy Property Settings</i>	200
<i>Isolation Policies</i>	201
Review All the Key Topics	202
Definition of Key Terms	203
Chapter 5 Installing and Configuring Domain Name System (DNS)	205
“Do I Know This Already?” Quiz	206
Introduction to DNS	210
Hierarchical Nature of DNS	211
<i>Root-Level Domains</i>	212
<i>Top-Level Domains</i>	212
<i>Second-Level Domain Names</i>	214
<i>Host Names</i>	214
DNS Name Resolution Process	215
<i>Recursive Queries</i>	215
<i>Iterative Queries</i>	216
<i>Reverse Lookup Queries</i>	217
Installing DNS in Windows Server 2008 R2	218
Using the Command Line to Install DNS	221
Using the Command-Line for DNS Server Administration	222
Configuring DNS Server Properties	223
Interfaces Tab	223
Forwarders Tab	224
<i>Conditional Forwarders</i>	227
Advanced Tab	228
<i>Server Options</i>	229
<i>Disable Recursion</i>	229
<i>Name Checking</i>	230

	<i>Loading Zone Data</i>	231
	Root Hints Tab	231
	Debug Logging Tab	233
	Event Logging Tab	235
	Trust Anchors Tab	235
	Monitoring Tab	237
	DNS Socket Pooling	238
	DNS Cache Locking	239
	Review All the Key Topics	241
	Definition of Key Terms	241
Chapter 6	Configuring DNS Zones and Replication	243
	“Do I Know This Already?” Quiz	243
	Zone Types and Their Uses	249
	DNS Zone Types	249
	<i>Primary Zones</i>	249
	<i>Secondary Zones</i>	250
	<i>Active Directory–Integrated Zones</i>	250
	<i>Stub Zones</i>	251
	<i>Forward and Reverse Lookup Zones</i>	251
	<i>GlobalNames Zones</i>	252
	DNS Name Server Roles	253
	<i>Primary Name Servers</i>	253
	<i>Secondary Name Servers</i>	254
	<i>Caching-Only Servers</i>	255
	<i>Forwarders</i>	255
	<i>Slave Servers</i>	256
	Configuring DNS Zones	257
	Creating New DNS Zones	257
	<i>Creating a Reverse Lookup Zone</i>	259
	<i>Creating Secondary Zones</i>	261
	<i>Creating Stub Zones</i>	262
	<i>Creating a GlobalNames Zone</i>	262
	Configuring DNS Zone Properties	263
	<i>Configuring Zone Types</i>	264
	<i>Adding Authoritative DNS Servers to a Zone</i>	265

	<i>Dynamic DNS, Non-Dynamic DNS, and Secure Dynamic DNS</i>	266
	<i>Zone Scavenging</i>	267
	<i>Integrating DNS with WINS</i>	269
	Subdomains and Zone Delegation	270
	Configuring DNS Zone Transfers and Replication	274
	Active Directory DNS Replication	274
	<i>Application Directory Partitions</i>	274
	<i>Replication Scope</i>	275
	Types of Zone Transfers	277
	<i>Full Zone Transfer</i>	277
	<i>Incremental Zone Transfer</i>	278
	<i>Configuring Zone Transfers</i>	279
	<i>Configuring DNS Notify</i>	281
	Secure Zone Transfers	282
	Auditing of DNS Replication	283
	Troubleshooting DNS Zones and Replication	287
	Using the <code>ipconfig</code> , <code>ping</code> , and <code>nslookup</code> Commands	288
	Use of the DNSLint Tool	290
	Review All the Key Topics	291
	Complete the Tables and Lists from Memory	292
	Definition of Key Terms	292
Chapter 7	Configuring DNS Records	295
	“Do I Know This Already?” Quiz	295
	Resource Record Types and Their Uses	299
	Creating New Resource Records	300
	<i>New Host (A or AAAA) Records</i>	301
	<i>New Alias (CNAME) Records</i>	302
	<i>New Mail Exchanger (MX) Records</i>	303
	<i>Additional New Resource Records</i>	304
	Using the Command Line to Create Resource Records	307
	Configuring Resource Record Properties	308
	Configuring SOA Resource Record Properties	309
	<i>Time to Live</i>	311

	Configuring Name Server Resource Record Properties	311
	Registering Resource Records	314
	Using the DnsUpdateProxy Group	314
	Configuring Round Robin	316
	Enabling Netmask Ordering	317
	Configuring DNS Record Security and Auditing	317
	Review All the Key Topics	319
	Complete the Tables and Lists from Memory	319
	Definition of Key Terms	319
Chapter 8	Configuring Client Computer Name Resolution	321
	“Do I Know This Already?” Quiz	321
	Configuring DNS Client Computer Settings	326
	Specifying DNS Server Lists	326
	Configuring DNS Suffix Search Order Lists	328
	Configuring a Client Computer’s Primary DNS Suffix	330
	Using Group Policy to Configure DNS Client Settings	331
	Using the <code>ipconfig</code> Command to Update and Register DNS Records	334
	Using the <code>dnscmd</code> Command to Update the DNS Server Cache	334
	Other Types of Name Resolution	335
	HOSTS Files	335
	NetBIOS Name Resolution	337
	<i>NetBIOS Broadcasts</i>	337
	<i>LMHOSTS Files</i>	339
	<i>WINS Servers</i>	340
	<i>Troubleshooting NetBIOS Problems</i>	344
	Link Local Multicast Name Resolution	345
	Review All the Key Topics	348
	Complete the Tables and Lists from Memory	349
	Definition of Key Terms	349
Chapter 9	Configuring File Servers	351
	“Do I Know This Already?” Quiz	351
	Shared Folders in Windows Server 2008 R2	358
	Understanding the File Services Role in Windows Server 2008 R2	358

Using the Network and Sharing Center to Configure File Sharing	360
<i>Sharing Files, Folders, and Printers</i>	362
<i>Modifying Shared Folder Properties</i>	363
<i>Mapping a Drive</i>	367
<i>Using the net share Command to Manage Shared Folders</i>	368
NTFS Permissions	369
NTFS File and Folder Permissions	369
<i>Applying NTFS Permissions</i>	371
<i>Specifying Advanced Permissions</i>	373
<i>Configuring NTFS Permissions Inheritance</i>	376
<i>Taking Ownership of Files and Folders</i>	377
Effective Permissions	379
<i>Viewing a User's Effective Permissions</i>	380
Copying and Moving Files and Folders	381
<i>Copying Files and Folders with NTFS Permissions</i>	381
<i>Moving Files and Folders with NTFS Permissions</i>	382
<i>Using the Mouse to Copy or Move Objects from One Location to Another</i>	383
Practical Guidelines on Sharing and Securing Folders	383
Data Encryption	384
Encrypting File System	384
<i>Encrypting File System Basics</i>	385
<i>Preparing a Disk for EFS</i>	386
<i>Encrypting Files</i>	387
<i>Backing Up EFS Keys</i>	389
<i>Decrypting Files</i>	391
<i>EFS Recovery Agents</i>	392
<i>EFS Group Policies</i>	393
BitLocker Drive Encryption	395
<i>Preparing Your Computer to Use BitLocker</i>	397
<i>Enabling BitLocker</i>	397
<i>Managing BitLocker</i>	402
<i>Configuring BitLocker Group Policies</i>	403
<i>Using Data Recovery Agents</i>	405
Additional File Server Management Resources	408
Using Offline Files	408

<i>Configuring Servers for Offline Files</i>	409
<i>Configuring Client Computers</i>	411
<i>Configuring Offline File Policies</i>	411
<i>Configuring Transparent Caching of Offline Files</i>	413
Configuring BranchCache	414
<i>Using the netsh Command to Configure BranchCache</i>	415
<i>Using Group Policy to Enable BranchCache</i>	417
<i>Specifying BranchCache Firewall Rules</i>	418
<i>Understanding BranchCache Network Infrastructure Requirements</i>	419
<i>Using BranchCache across a Virtual Private Network</i>	419
<i>Managing Certificates with BranchCache</i>	420
Using Share and Storage Management Console	421
<i>Using Share and Storage Management to Provision Shared Resources and Volumes</i>	422
<i>Using Share and Storage Management to Manage Shared Resources</i>	425
Review All the Key Topics	426
Complete the Tables and Lists from Memory	427
Definition of Key Terms	427
Chapter 10 Configuring Distributed File System (DFS)	429
“Do I Know This Already?” Quiz	429
DFS Concepts	433
Improvements to DFS in Windows Server 2008 R2	434
Installing DFS on a Windows Server 2008 R2 Computer	435
Managing DFS Namespaces	438
Creating Additional DFS Namespaces	438
Managing Namespaces	439
Adding Folders to DFS Namespaces	440
Adding Namespace Servers	441
Configuring Referrals	441
Enabling Access-Based Enumeration of a DFS Namespace	443
Configuring Polling of Domain Controllers	444
Managing DFS Replication	445
Setting Up DFS Replication	447

Replication Topologies	449
Working with Replication Groups	450
<i>Adding New Connections</i>	450
<i>Adding Replicated Folders</i>	451
<i>Designating Read-Only Replicated Folders</i>	451
<i>Adding Members to Replication Groups</i>	451
<i>Sharing or Publishing Replicated Folders</i>	451
Configuring Failover Cluster Support	452
Generating Replication Health Reports	454
Review All the Key Topics	456
Complete the Tables and Lists from Memory	457
Definition of Key Terms	457
Chapter 11 Configuring Backup and Restore	459
“Do I Know This Already?” Quiz	459
Protecting Data with Windows Backup	464
Backup Permissions	466
Installing Windows Server Backup	466
Backing Up Your File Server	467
<i>Performing a Bare Metal Backup</i>	472
Scheduling a Backup	472
Using the <code>wbadmin</code> Command	474
Restoring the Backup Catalog	475
Managing Backups Remotely	476
Volume Shadow Copies	477
Using Windows Explorer to Manage Shadow Copies	478
Using the Command Line to Manage Shadow Copies	480
Using Volume Shadow Copies to Recover a File or Folder	480
Restoring Data from Backup	482
Using Windows Backup to Recover Data	482
Restoring User Profiles	485
Recovering System State	486
Performing a Full Server or Bare Metal Recovery of a Windows Server 2008 R2 Computer	488
Using the <code>wbadmin</code> Command to Recover Your Server	491
Review All the Key Topics	492

Complete the Tables and Lists from Memory	493
Definition of Key Terms	493
Chapter 12 Managing File Server Resources	495
“Do I Know This Already?” Quiz	495
File Server Resource Manager	500
Installing FSRM	501
Managing File Screening	501
<i>Using File Groups</i>	502
<i>Creating File Screens and Templates</i>	503
<i>Creating File Screen Exceptions</i>	506
<i>Monitoring File Screening</i>	506
Managing Storage Reports	506
<i>Specifying Report Parameters</i>	507
<i>Additional FSRM Options</i>	508
<i>Scheduling Report Generation</i>	509
Managing File Classification	511
Configuring File-Management Tasks	514
Configuring Disk and Volume Quotas	516
Using Windows Explorer to Enable Disk Quotas	516
Using FSRM to Enable Quotas	519
<i>Using FSRM to Create Quota Templates</i>	520
Some Guidelines for Using Quotas	522
Storage Manager for SANs	523
Review All the Key Topics	527
Complete the Tables and Lists from Memory	528
Definition of Key Terms	528
Chapter 13 Configuring and Monitoring Print Services	531
“Do I Know This Already?” Quiz	531
Printing Terminology in Windows Server 2008 R2	537
Printing Process	538
Installing, Sharing, and Publishing Printers	539
Installing the Print and Document Services Role	540
Installing Printers	541
<i>Using Control Panel to Install a Printer</i>	542
<i>Using the Print Management Console to Install a Printer</i>	544

Sharing Printers	545
Publishing Printers in Active Directory	546
Using Group Policy to Deploy Printer Connections	548
Managing and Troubleshooting Printers	549
Using the Printer Properties Dialog box	549
<i>General Tab</i>	549
<i>Ports Tab and Printer Pooling</i>	549
<i>Advanced Tab</i>	551
<i>Security Tab and Printer Permissions</i>	553
Migrating Print Queues and Printer Settings	556
Isolating Printer Drivers	557
Configuring Location-Aware Printer Settings	558
Delegating Print Management	559
Troubleshooting Printer Problems	561
<i>Some Common Problems</i>	561
<i>Printer Port Problems</i>	562
<i>Enabling Notifications</i>	562
Review All the Key Topics	564
Complete the Tables and Lists from Memory	565
Definition of Key Terms	565
Chapter 14 Configuring Remote Access	567
“Do I Know This Already?” Quiz	567
Remote Access Protocols	573
Remote Access Authentication Protocols	574
New Features of RRAS in Windows Server 2008	576
Configuring Dial-Up Connections	577
Configuring a RAS Server for Dial-Up	577
Configuring Dial-Up RAS Server Properties	579
Enabling Modems used by the Dial-Up RAS Server	581
Configuring Windows Server 2008 as a RAS Client	583
Network Address Translation	584
Enabling the NAT Server for DHCP	586
Enabling Addresses, Services, and Ports on the NAT Server	588
Configuring Internet Connection Sharing	589

Virtual Private Networking	590
How VPNs Function	591
<i>VPN Encapsulation</i>	591
<i>Authentication</i>	591
<i>Data Encryption</i>	592
Configuring a RRAS Server for VPN	592
Creating and Authenticating VPN Connections	594
Configuring VPN Connection Security	596
Enabling VPN Reconnect	598
Configuring Advanced Security Auditing	599
Using Remote Access Policies	601
Configuring VPN Packet Filters	601
Connection Manager	603
Installing the Connection Manager Administration Kit	605
Using Connection Manager Administration Kit to Create a Profile	605
Using the Connection Manager Client Interface	610
Review All the Key Topics	612
Complete the Tables and Lists from Memory	613
Definition of Key Terms	613
Chapter 15 Configuring Network Policy Server (NPS)	615
“Do I Know This Already?” Quiz	615
Wireless Networking Protocols and Standards	619
Wireless Networking Standards	620
Planning the Authentication Methods for a Wireless Network	621
Planning the Encryption Methods for a Wireless Network	622
<i>Wired Equivalent Privacy</i>	622
802.1X	622
<i>Use of IPSec with Wireless Networks</i>	623
The IEEE 802.3 Wired Standard	623
Planning and Configuring Wireless Access Policies	623
<i>Creating a Wireless Access Policy for Windows Vista/7 Clients</i>	624
<i>Creating a Wireless Access Policy for Windows XP Clients</i>	628
Configuring IEEE 802.3 Wired Access Policies	630
RADIUS in Windows Server 2008 R2	633
Installing NPS on a Windows Server 2008 RRAS Server	634

Configuring the NPS Server for Wireless Access	635
Configuring New RADIUS Clients	638
Creating RADIUS Proxies and Proxy Groups	639
Creating Connection Request Policies	641
Configuring RADIUS Accounting	644
Configuring NPS Templates	647
Review All the Key Topics	649
Complete the Tables and Lists from Memory	650
Definition of Key Terms	650
Chapter 16 Configuring Network Access Protection (NAP)	653
“Do I Know This Already?” Quiz	653
Concepts of NAP	658
Components of a Typical NAP Deployment	660
What’s New with NAP in Windows Server 2008 R2	662
NAP Enforcement	663
DHCP Enforcement	663
<i>Enabling NAP on the DHCP Server’s Scopes</i>	667
VPN Enforcement	668
IPSec Enforcement	670
<i>Installing and Configuring an HRA Server</i>	671
<i>Configuring NAP for IPSec Enforcement</i>	674
<i>Configuring the HRA for Health Certificates</i>	674
<i>Using Group Policy to Specify IPSec Enforcement</i>	675
802.1X Enforcement	676
RDS Enforcement	678
System Health Validation	680
Configuring the Windows Security Health Validator	681
<i>Configuring Error Codes</i>	683
<i>Using Multi-Configuration SHV</i>	683
Configuring NAP Policies	684
Review All the Key Topics	689
Definition of Key Terms	690
Chapter 17 Configuring DirectAccess	693
“Do I Know This Already?” Quiz	693

Concepts of DirectAccess	698
DirectAccess Server Requirements	700
<i>Using IPv6 with DirectAccess</i>	701
<i>Using Network Access Protection</i>	701
DirectAccess Client Requirements	702
DirectAccess Connection Process	702
Configuring the DirectAccess Server	703
Installing and Configuring the DirectAccess Server Feature	703
DirectAccess and the Perimeter Network	707
Configuring Authentication	708
Group Policy and DirectAccess	708
Using Group Policy to Configure DirectAccess Clients	708
Name Resolution Policy Table	710
<i>Using NRPT Exemptions</i>	714
Review All the Key Topics	716
Complete the Tables and Lists from Memory	716
Definitions of Key Terms	716
Chapter 18 Windows Server Update Services (WSUS) Server Settings	719
“Do I Know This Already?” Quiz	719
Concepts of WSUS	724
Purposes of Windows Update and WSUS	724
New Features of WSUS 3.0	725
Installing and Configuring a WSUS Server	727
Installing WSUS on a Windows Server 2008 R2 Computer	728
<i>Installing Microsoft Report Viewer Redistributable 2008</i>	731
Getting Started with WSUS	731
Configuring WSUS Options	733
Testing Updates	738
<i>Using Computer Groups</i>	738
<i>Configuring Client-Side Targeting</i>	741
Approving Updates	742
Declining Updates	744
Viewing Reports	745
Using WSUS on a Disconnected Network	747

Configuring Client Computers for WSUS 748

About the Author

Don Poulton (A+, Network+, Security+, MCSA, MCSE) is an independent consultant who has been involved with computers since the days of 80-column punch cards. After a career of more than 20 years in environmental science, Don switched careers and trained as a Windows NT 4.0 MCSE. He has been involved in consulting with a couple of small training providers as a technical writer, during which time he wrote training and exam-prep materials for Windows NT 4.0, Windows 2000, and Windows XP. Don has written or contributed to several titles, including *Security+ Lab Manual* (Que, 2004), *MCSA/MCSE 70-299 Exam Cram 2: Implementing and Administering Security in a Windows 2003 Network (Exam Cram 2)* (Que, 2004), *MCSE 70-294 Exam Prep: Planning, Implementing, and Maintaining a Microsoft Windows Server 2003 Active Directory Infrastructure* (Que, 2006), *MCTS 70-620 Exam Prep: Microsoft Windows Vista, Configuring* (Que, 2008), *MCTS 70-680 Exam Prep: Microsoft Windows 7, Configuring* (Que, 2011), and *MCTS 70-640 Exam Prep: Microsoft Windows Server 2008 Active Directory, Configuring* (Que, 2011).

In addition, Don has worked on programming projects, both in his days as an environmental scientist and, more recently, with Visual Basic to update an older statistical package used for multivariate analysis of sediment contaminants.

When not working on computers, Don is an avid amateur photographer who has had his photos displayed in international competitions and published in magazines such as *Michigan Natural Resources Magazine* and *National Geographic Traveler*. Don also enjoys traveling and keeping fit.

Don lives in Burlington, Ontario, with his wife, Terry.

Dedication

I would like to dedicate this book to my wife, Terry, who has stood by my side and supported me throughout the days spent writing this book. This project would not have been possible without her love and support.

Acknowledgments

I would like to thank the staff at Pearson and, in particular, Betsy Brown for making this project possible. My sincere thanks goes out to Chris Crayton and Darril Gibson for their helpful technical suggestions, as well as Jeff Riley, development editor, and Sheri Cain, copy editor, for their improvements to the manuscript.

—Don Poulton

About the Technical Reviewers

Christopher A. Crayton is an author, technical editor, technical consultant, security consultant, trainer, and SkillsUSA state-level technology competition judge. Formerly, he worked as a computer and networking instructor at Keiser College (2001 Teacher of the Year); as network administrator for Protocol, a global electronic customer relationship management (eCRM) company; and at Eastman Kodak Headquarters as a computer and network specialist. Chris has authored several print and online books, including *The A+ Exams Guide*, Second Edition (Cengage Learning, 2008), *Microsoft Windows Vista 70-620 Exam Guide Short Cut* (O'Reilly, 2007), *CompTIA A+ Essentials 220-601 Exam Guide Short Cut* (O'Reilly, 2007), *The A+ Exams Guide*, *The A+ Certification and PC Repair Handbook* (Charles River Media, 2005), and *The Security+ Exam Guide* (Charles River Media, 2003) and *A+ Adaptive Exams* (Charles River Media, 2002). He is also co-author of the *How to Cheat at Securing Your Network* (Syngress, 2007). As an experienced technical editor, Chris has provided many technical edits/reviews for several major publishing companies, including Pearson, McGraw-Hill, Cengage Learning, Wiley, O'Reilly, Syngress, and Apress. He holds MCSE, A+, and Network+ certifications.

Darril Gibson has authored or coauthored more than a dozen books and contributed as a technical editor to many more. He holds several IT certifications, including CompTIA A+, Network+, Security+, CASP, (ISC)2 SSCP, CISSP, MCSA, MCSA Messaging (2000, 2003), MCSE (NT 4.0, 2000, 2003), MCDBA (SQL 7.0, 2000), MCITP (Vista, Windows 7, Server 2008, SQL 2005, SQL 2008), MCTS (Server 2008, SQL Server 2008), MCSA (6.0, .NET), and ITIL Foundations v 3.0. He is the CEO of Security Consulting and Training, LLC, and actively teaches, writes, and consults on a variety of IT topics. He regularly blogs at blogs.getcertifiedgetahead.com.

We Want to Hear from You!

As the reader of this book, *you* are our most important critic and commentator. We value your opinion and want to know what we're doing right, what we could do better, what areas you'd like to see us publish in, and any other words of wisdom you're willing to pass our way.

As an associate publisher for Pearson, I welcome your comments. You can e-mail or write me directly to let me know what you did or didn't like about this book—as well as what we can do to make our books better.

Please note that I cannot help you with technical problems related to the topic of this book. We do have a User Services group, however, where I will forward specific technical questions related to the book.

When you write, please be sure to include this book's title and author, as well as your name, e-mail address, and phone number. I will carefully review your comments and share them with the author and editors who worked on the book.

E-mail: feedback@pearsonitcertification.com

Reader Services

Visit our website and register this book at www.quepublishing.com/register for convenient access to any updates, downloads, or errata that might be available for this book.

This chapter covers the following subjects:

- **Printing Terminology in Windows Server 2008 R2:** This section introduces key terminology and concepts you must be aware of to administer printers. It also reviews the actions that occur when a user submits a print job.
- **Installing, Sharing, and Publishing Printers:** This section shows you how to install the Print and Document Services server role and then covers the installation, sharing, and publication of printers.
- **Managing and Troubleshooting Printers:** Print servers and printers come with a large array of properties you must be aware of to effectively manage a corporate printing environment. This section introduces you to the management of these properties, as well as the topic of granting permissions to printers and print servers and troubleshooting common printer problems.

Configuring and Monitoring Print Services

Resources on a Windows Server 2008 network go beyond the subject of files and folders that have been the subject of Chapter 9, “Configuring File Servers,” and subsequent chapters. An important component of any business network is the capability to print documents in a timely and accurate manner, and Windows Server 2008 R2 provides the Print and Document Services server role to assist administrators in setting up print servers and keeping printing capabilities operating properly. Typically, a print server is a computer to which you connect a print device and share so that many people across your network, and even across the Internet, can print to the printer.

In any case, clients that print to the printer can be running a variety of platforms and not just Windows systems. Windows Server 2008 supports hundreds of print devices from a large number of printer manufacturers. This chapter introduces you to the management of printers, which is an important topic—both in real life and on the 70-642 exam.

“Do I Know This Already?” Quiz

The “Do I Know This Already?” quiz allows you to assess whether you should read this entire chapter or simply jump to the “Exam Preparation Tasks” section for review. If you are in doubt, read the entire chapter. Table 13-1 outlines the major headings in this chapter and the corresponding “Do I Know This Already?” quiz questions. You can find the answers in Appendix A, “Answers to the ‘Do I Know This Already?’ Quizzes.”

Table 13-1 “Do I Know This Already?” Foundation Topics Section-to-Question Mapping

Foundations Topics Section	Questions Covered in This Section
Printing Terminology in Windows Server 2008 R2	1–2
Installing, Sharing, and Publishing Printers	3–5
Managing and Troubleshooting Printers	6–12

1. In Microsoft terminology, which of the following is the best definition of a printer?
 - a. The program that converts graphic commands into instructions that the print device is able to understand.
 - b. The physical (hardware) device that produces the printed output.
 - c. The computer that handles the printing process on the network.
 - d. The software (logical) interface between the operating system and the physical print device.

2. Your print server is configured so that print jobs are copied to a reserved area within the system root folder of the computer before being sent to the print device. What is this action called?
 - a. Preprinting
 - b. Spooling
 - c. Creation of an enhanced metafile (EMF)
 - d. Routing

3. You purchased a new print device for your company's network. The print device is equipped with its own network adapter so that it can be directly connected to the network. You attached the print device to the network and are at the print server and want to install it. What program should you use? (Each correct answer represents a complete solution. Choose two answers).
 - a. Print Management snap-in
 - b. Add Roles Wizard in Server Manager
 - c. Windows Explorer
 - d. Device Manager
 - e. Control Panel Devices and Printers

4. You installed and shared a new printer on your Windows Server 2008 R2 computer, which is configured with the Print and Document Service server role. Users printing documents from Windows 7 computers receive their documents properly, but users printing from Windows XP computers receive documents full of illegible characters. What should you do?
 - a. From the Sharing tab of the Properties dialog box for the printer, select the **Render print jobs on client computers** option.
 - b. From the Sharing tab of the Properties dialog box for the printer, click **Additional Drivers**. Then, select drivers for Windows XP from the Additional Drivers dialog box and click **OK**.

- c. From the Security tab of the Properties dialog box for the printer, add a group that contains the users of Windows XP computers and grant them the **Manage Documents** permission.
 - d. Install a new printer from the Print Management snap-in. Configure this printer to point to the same print device and provide a unique share name that references users of Windows XP computers.
 5. You are responsible for printers connected to Windows Server 2008 R2 print servers in your company's AD DS domain. These servers are configured as member servers in the domain. You installed a printer that should be accessible to computers in the Graphics department, but not to computers in other departments. All resources in this department are located in the Graphics organizational unit (OU). What should you do?
 - a. From the Sharing tab of the printer's Properties dialog box, select the **List in the directory** option.
 - b. Right-click this printer in the details pane of the Print Management snap-in and choose **List in Directory**.
 - c. Right-click this printer in the details pane of the Print Management snap-in and choose **Deploy with Group Policy**. Choose a GPO that is linked to the Graphics OU and select the option labeled **The users that this GPO applies to (per user)**.
 - d. Right-click this printer in the details pane of the Print Management snap-in and choose **Deploy with Group Policy**. Choose a GPO that is linked to the Graphics OU and select the option labeled **The computers that this GPO applies to (per machine)**.
 6. You are responsible for the print servers and printers on your company's network. You configured a shared printer (HP40001) on Server1. Server2 also has an identical shared printer (HP40002). HP40001 on Server1 experiences a catastrophic paper jam. Many jobs are waiting to be printed in Server1's print queue. How can you ensure that these print jobs are printed without the need to ask the users to resubmit their print jobs to Server2?
 - a. From the **Ports** tab of the HP40001 Properties dialog box, select **Enable printer pooling**. Include HP40002 and HP40001 in the pool.
 - b. Rename the shared printer HP40001 to HP40002.
 - c. In the Printers folder on the Server1, add a network printer called HP40003, pointing to HP40002 on Server2. Rename printer HP40001 to HP4000X. Then, rename HP40003 to HP40001.
 - d. Select the **Ports** tab of the HP40001 Properties dialog box, click **Add Port**, choose **Local Port**, click **New Port**, and assign the UNC name `\\Server2\HP40002` to the new port.

7. The boss is fed up with waiting for her documents to print and wants to be sure the account statement prints immediately when it is needed. What is the simplest thing to do so that this will happen properly?
 - a. Ask her secretary to come in at 7 a.m. and print the account statement.
 - b. When she needs to print the account statement, have her go to the printer properties and click **Cancel All Documents**, before printing the document.
 - c. Configure a printer that points to the same print device and has the priority set at 99. Configure this printer's permissions so that only the boss has the Print permission and direct her to print the account statement on this printer.
 - d. Configure her user account to have the **Prioritize Documents** permission.

8. You are responsible for managing the print servers and printers in your company's domain. A user calls and informs you that he has sent a large print job to the printer and has realized that he must make several changes to the document. So, he wants to delete the print job. What permission do you need to grant the user so that he can delete this job?
 - a. Allow the user the **Manage this printer** permission.
 - b. Allow the user the **Manage documents** permission.
 - c. Allow the user the **Special permissions** permission, click **Advanced**, and then allow him the **Delete** permission.
 - d. You don't need to do anything; he can delete his print jobs without additional permissions.

9. You are responsible for maintaining the printers on your company's AD DS network, which includes one domain with three print servers and 12 printers. You purchased a powerful new computer and installed Windows Server 2008 R2 and the Print and Document Management server role. You want to consolidate all the existing printers on the new server. What should you do to accomplish this task with the least amount of administrative effort?
 - a. At each existing print server, select the **Export printers to a file** option. Complete the steps in the Printer Migration Wizard that starts to save printer export information to a file. Then, at the new server, select the **Import printers from a file** option. Then, use the Printer Migration Wizard to import the previously exported printer information.

- b. Use Windows Server Backup at each existing print server to back up the contents of the print server. Then, at the new server, use Windows Server Backup to restore the information that was backed up from each existing print server.
 - c. Connect to the %systemroot%\system32\spool\printers folder on each existing print server and copy the contents of this folder to the same folder on the new print server. Repeat this task at each of the remaining print servers.
 - d. At the new print server, run the Printer Installation Wizard to install each of the printers in turn, selecting the **Search the network for printers** option to ensure that you selected and installed the printers.
10. You are a tech-support specialist at your company. A Windows Server 2008 R2 computer is configured as a print server. This server supports several different types of printers, including color ink-jet and laser models. After updating the driver for the color ink-jet printers, users report that their print jobs printed at either the color ink-jet or laser printers contain unintelligible characters. Checking the website for the color ink-jet printer manufacturer, you notice that they have withdrawn the latest driver and will be issuing one within a few days. What action should you take to enable users to print from the laser printer with the least amount of delay?
- a. Install new printers for the laser print device at another server running Windows Server 2008 R2.
 - b. Open Device Manager on the print server and access the Driver tab of the laser printer's Properties dialog box. Then, click the **Roll Back Driver** button.
 - c. From the Print Management snap-in at the print server, right-click the driver and choose **Set Driver Isolation > None**.
 - d. From the Print Management snap-in at the print server, right-click the driver and choose **Set Driver Isolation > Isolated**.

11. You are responsible for several printers installed on a Windows Server 2008 R2 print server on your network, which is configured as a workgroup. You want to allow a secretary named Evelyn to have the ability to view and manage print queues, but do not want her to have any other administrative capabilities on the network. What should you do?
 - a. Access the **Security** tab of the Print Server Properties dialog box and add Evelyn to list of user or group names. Then, select the **View Server, Print, Manage Documents, and Manage Printer** permissions under the Allow column.
 - b. Access the **Security** tab of the Print Server Properties dialog box and add Evelyn to list of user or group names. Then, select the **View Server** and **Manage Server** permissions under the Allow column.
 - c. Open the Computer Management snap-in and select the Groups sub-node under the Local Users and Groups node. Then, add Evelyn's user account to the Print Operators group.
 - d. Open the Computer Management snap-in and select the Groups sub-node under the Local Users and Groups node. Then, add Evelyn's user account to the Power Users group.

12. You are responsible for the printers installed on your Windows Server 2008 R2 print server named Server3. This server is a member server in your company's AD DS domain. A user attempting to print to a printer named Printer2 discovers that he is unable to print. Checking with several other users, you discover that nobody has been able to print since yesterday afternoon. Attempting to print from your Windows 7 desktop computer, you discover that you are unable to print and receive the following message: *Printer2 on Server3 is unable to connect.* But, you are able to ping Server3 from your desktop computer. What should you do to re-enable printing?
 - a. From the Sharing tab of the Printer2 Properties dialog box, select the option labeled **Render print jobs on client computers**.
 - b. Restart the Print Spooler service on Server3.
 - c. In the details pane of the Print Management snap-in on Server3, right-click **Printer2** and choose **List in Directory**.
 - d. Install a new printer on Server3, and configure this printer to print to the same print device. Then, instruct the users to resubmit their print jobs to this printer.

Foundation Topics

Printing Terminology in Windows Server 2008 R2

We are all used to thinking of a printer as the machine that spews out printed pages. But, Microsoft has its own terminology (which it has used ever since the days of Windows NT and 9x), which you need to be aware of. Table 13-2 describes the official Microsoft definitions.

Table 13-2 Printing Terminology Used by Windows Computers

**Key
Topic**

Term	Description
Printer	The software (logical) interface between the operating system and the print device. In other words, a printer is part of the software and a print device is hardware. What this means is that a printer is the way that Windows sees where it is sending print jobs. This is true for all Windows versions, client or server.
Print device	The physical (hardware) device that produces the printed output. This device can be connected directly to your computer using a parallel (LPT) port, a USB connection, or a wireless connection (such as infrared [IR]); or it can be attached to the network by means of its own network interface card (NIC).
Print server	The computer that controls the entire printing process on a Windows network. The print server handles printing requests from all its clients. It can be running either a server operating system such as Windows Server 2003 or 2008, or a client such as Windows XP, Vista, or 7; however, print servers on client operating systems are limited to 10 concurrent connections.
Print driver	The program that converts graphics commands into instructions a given type of print device can understand.
Printer ports	The software interface (such as LPT1) between the computer and the print device.
Print queue	A waiting area where print jobs are stored and sequenced as they await the print device. Jobs are sequenced according to the order in which they are received as well as priority settings that are discussed later in this chapter.
Print spooling	The act of writing the contents of a print job to disk before sending it on to the print device. This can improve performance by eliminating the print device as a bottleneck that ties up the operating system or an application until the entire print job is output by the print device. In Windows 7 and Windows Server 2008, the default folder for spooling is located at %systemroot%\system32\spool\printers. You can change this location by altering the print server properties (Advanced tab) or the appropriate key in the Registry.

TIP Remember that Microsoft considers a “printer” to be the software interface between the print server and the physical print device, and a “print device” to be the actual hardware device that produces the printed output. This convention is used on Microsoft exams.

Printing Process

When a user selects **File > Print** from an application, a series of steps must be completed for the printed document to appear. These steps have remained much the same over all recent versions of Windows:

1. When the user selects **File > Print**, a new print job is created, which includes all the data, and eventually, the printer commands that the system requires to output a document.
2. The client computer queries the print server for a version of the print driver for the default or a selected printer. If necessary, the most recent version of the driver is downloaded to the client computer.
3. The graphics device interface (GDI) and the printer driver may convert the print job into a rendered Windows enhanced metafile (EMF). (The GDI is the component that provides network applications with a system for presenting graphical information.) The GDI actually does double duty by producing WYSIWYG (what you see is what you get) screen output and printed output.
4. It is possible for Windows to convert the application’s output (the print job) into either a metafile or a RAW format. (The RAW format is ready to print and requires no further rendering.) The driver then returns the converted print job to the GDI, which delivers it to the spooler.
5. The client side of the spooler (`winspool.drv`) makes a remote procedure call (RPC) to the server side of the spooler (`spoolsv.dll`). If a network-connected server is managing the print device, the spooler hands off the print job to the spooler on the print server. Then, that spooler copies the print job to a temporary storage area on that computer’s hard disk. This step does not take place for locally managed print jobs. In that case, the job is spooled to disk locally.
6. The print server receives the job and passes it to the print router, `spoolss.dll`. (You should not confuse a router in this context with the device that directs network packets from one subnetwork to another.)

7. The router checks the kind of data it has received and passes it on to the appropriate print processor component of the local print provider, or the remote print server if the job is destined for a network printer.
8. The local print provider may request that the print processor perform additional conversions as needed on the file, typically from EMF to RAW. (Print devices can only handle RAW information.) The print processor then returns the print job to the local print provider.
9. If a separator page is being used, the separator page processor on the local print provider adds a separator page to the print job and then passes the print job on to the appropriate print monitor. All recent versions of Windows support three types of print monitors: language, local port, and remote.
 - A language monitor provides the communications language used by the client and printer. In the case of bidirectional printers, this monitor allows you to monitor printer status and send notifications, such as `paper tray empty`.
 - The local port monitor (`LocalSp1.dll`) controls parallel, serial, and USB I/O ports where a printer may be attached, and sends print jobs to local devices on any of these ports.
 - The remote port monitor enables printing to remote printers. An example is the LPR port monitor, which can be used as an alternative to the standard port monitor for UNIX print servers.
10. The print monitor communicates directly with the print device and sends the ready-to-print print job to the print device.
11. The print device receives the data in the form it requires and translates it to a bitmap, producing printed output.

Although it may seem complicated, this sequence is designed to make printing more efficient and faster in a networked environment. In particular, the burden of spooling is distributed between client and server computers.

Installing, Sharing, and Publishing Printers

By itself, Windows Server 2008 R2 is a very capable print server that provides a large range of capabilities for working with printers and documents, much like the capabilities that were included with previous Windows Server versions. The original version of Windows Server 2008 added the Print Services server role, which provided enhanced capabilities for sharing printers on the network and centralizing printer and print management tasks into its own Microsoft Management Console

(MMC) snap-in. In Windows Server 2008 R2 this role is replaced by the Print and Document Services role, which adds scanning management to the list of capabilities.

NOTE For additional introductory information on the Print and Document Services server role, refer to “Print and Document Services” at [http://technet.microsoft.com/en-us/library/cc731636\(WS.10\).aspx](http://technet.microsoft.com/en-us/library/cc731636(WS.10).aspx).

Installing the Print and Document Services Role

Use the following procedure to install the Print and Document Services server role on a Windows Server 2008 R2 computer:

Key Topic

1. Open Server Manager and expand the Roles node.
2. Click **Add Roles** to start the Add Roles Wizard.
3. From the Select Server Roles page, select **Print and Document Services** (as shown in Figure 13-1) and click **Next**.

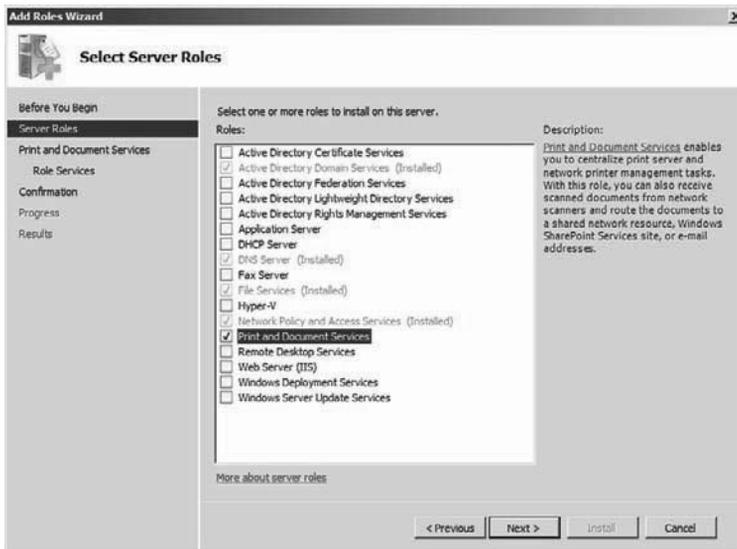

Figure 13-1 Selecting the Print and Document Services role.

4. The Introduction to Print and Document Services page provides links to information on this service. To learn more, click the links provided. When you're ready to proceed, click **Next**.

5. The Select Role Services page shown in Figure 13-2 enables you to select additional role services. The Print Server role is included by default. Make any desired selections and click **Next**.

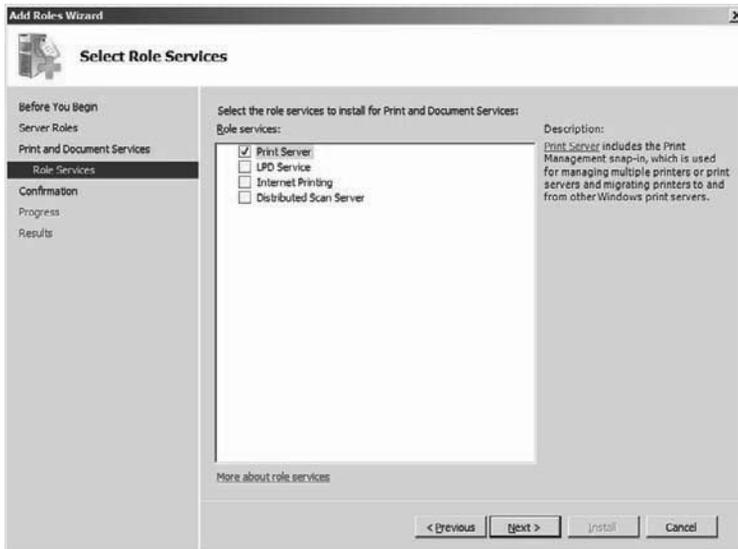

Figure 13-2 You can select optional role services from the Select Role Services page.

6. On the Confirm Installation Selections page, click **Install**.
7. The Installation Progress page tracks the progress of installing the Print and Document services server role. When informed that the installation is complete, click **Close**.

When finished, the Print Management snap-in is accessible from the Administrative Tools folder. This snap-in enables you to perform a large range of printer management tasks on printers installed on computers running any version of Windows from Windows 2000 or later. This chapter covers a large range of tasks you can perform from this snap-in.

Installing Printers

You can install a printer on your Windows Server 2008 R2 computer from Control Panel even without installing the Print and Document Services server role. If you installed this role, you can also install a printer from the Print Management snap-in. This section looks at both methods of installing a printer.

Using Control Panel to Install a Printer

Use the following procedure to install a printer from Control Panel:

Key Topic

1. Click **Start > Control Panel > Hardware**.
2. Under Devices and Printers, select **Add a printer**. The Add Printer Wizard starts and provides two options, as shown in Figure 13-3.

Figure 13-3 Windows Server 2008 enables you to choose between installing a local or network printer.

3. Select the appropriate option and click **Next**.
4. If you select the **Add a network, wireless, or Bluetooth printer** option, Windows searches for network printers. Select the desired printer and click **Next**. If you select the **Add a local printer** option, the Add Printer page asks you to choose a printer port. Select the port to which the printer is attached and click **Next**.
5. You receive the Install the printer driver page. Select the make and model of the print device for which you're installing the printer (as shown in Figure 13-4) and click **Next**. To install a driver from an installation CD, click **Have Disk** and follow the instructions provided.

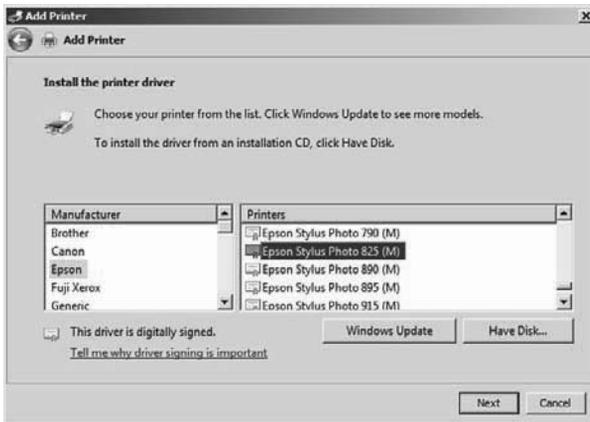

Figure 13-4 Selecting the make and model for which you're installing a printer.

6. The Type a Printer Name page provides a default name for the printer. Accept this or type a different name, and then click **Next**.
7. The Printer Sharing page shown in Figure 13-5 enables you to share the printer. Accept the share name or type a different name if necessary. Optionally, type location and comment information in the text boxes provided. (This information helps users when selecting a network printer.) When finished, click **Next**.

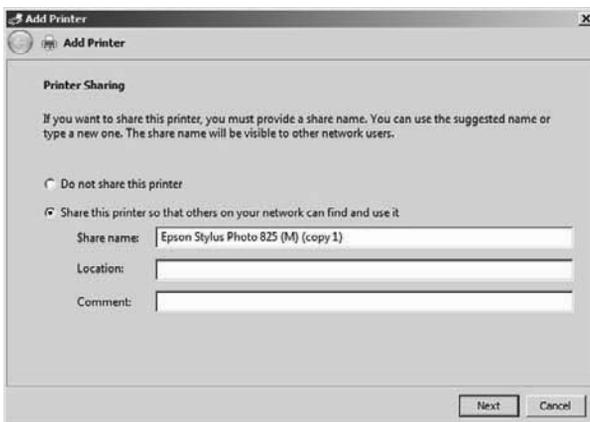

Figure 13-5 You are provided with options for sharing your printer.

8. You are informed that you successfully installed your printer. Click **Print a test page** to print a test page if desired to confirm printer installation. When done, click **Finish**.

NOTE If you are searching for a network printer at Step 4 of this procedure and the wizard is unable to locate the desired printer, click the link labeled **The printer that I want isn't listed**. The wizard displays a page that enables you to locate the printer in the directory, browse the network for a shared printer, or locate a printer based on IP address or hostname.

Using the Print Management Console to Install a Printer

After you install the Print and Document Management server role as described earlier in this chapter, you can install a printer directly from this console. Use the following procedure:

Key Topic

1. Click **Start > Administrative Tools > Print Management** to open the Print Management console.
2. Expand the Print Server node to locate your print server.
3. Right-click your print server and choose **Add Printer**. The Network Printer Installation Wizard starts and displays options, as shown in Figure 13-6.

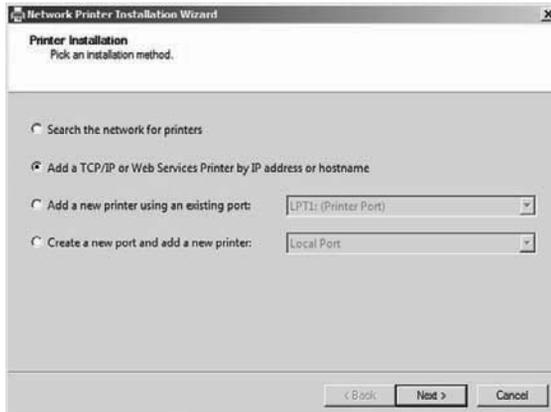

Figure 13-6 The Network Printer Installation Wizard facilitates installation of printers on the network.

4. Select the appropriate option and click **Next**.
5. If you select the **Add a TCP/IP or Web Services Printer by IP address or hostname** option, specify the host name or IP address as well as the port name on the Printer Address page, and then click **Next**. If you select the **Search the network for printers** option, the Network Printer Search page appears and displays the printers it finds. Select the desired printer and click **Next**.

6. On the Printer Driver page, select the make and model of the print device for which you're installing the printer, and then click **Next**.
7. The Type a printer name page provides a default name for the printer. Accept this or type a different name, and then click **Next**.
8. The Printer Sharing page provides options similar to those previously shown in Figure 13-5 that are provided when installing from Control Panel. Specify the required options and click **Next**.
9. If you receive a page asking for printer-specific configuration options, select the required options and then click **Next**. Options provided depend on the make and model of the print device associated with the printer you're installing.
10. You are informed that you successfully installed your printer. Click **Finish**.

When you finish installing the printer (whether from the Print Management snap-in or from Control Panel), the printer is displayed in the details pane of the Print Management snap-in when you select the **Printers** subnode under the node for your print server. From here, you can configure a series of management properties, as described in the sections to follow.

Sharing Printers

As indicated in the previous section, you can share a printer at the time you install it. You can configure printer sharing at any time. Use the following procedure:

1. In the console tree of the Print Management snap-in, expand your print server to reveal the Printers node. All printers configured for your server will appear in the details pane.
2. Right-click your desired printer and choose **Manage Sharing**. This opens the printer's Properties dialog box to the Sharing tab.
3. Select the **Share this printer** check box. As shown in Figure 13-7, a default share name is provided automatically; accept this or type a different share name, as desired.

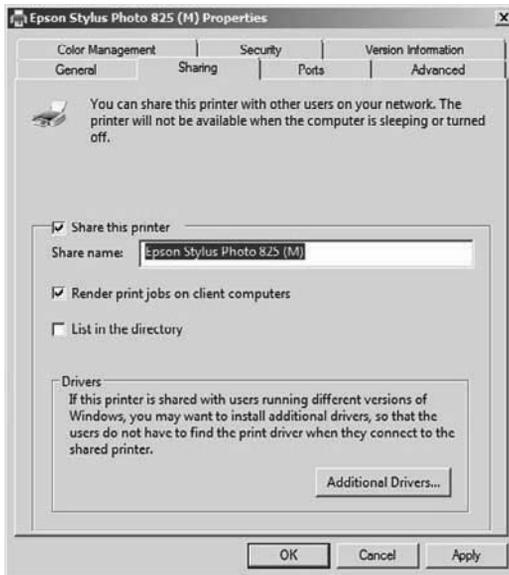

**Key
Topic**

Figure 13-7 You can share your printer from the Sharing tab of the printer's Properties dialog box.

4. If users connecting to this printer are running different versions of Windows (including 32-bit as opposed to 64-bit Windows versions), click **Additional Drivers** to install drivers required by these users. From the Additional Drivers dialog box that appears, select the required drivers and click **OK**.
5. If client computers have the processing power for handling the print rendering process, select the check box labeled **Render print jobs on client computers**. To have the print server handle this processing load, clear this check box.
6. Click **OK**.

If you haven't installed the Print and Document Services server role, you can perform the same task from the Devices and Printers applet in Control Panel. Right-click your printer and choose **Printer Properties**. This brings up the same Properties dialog box; select the **Sharing** tab, as shown previously in Figure 13-7, and follow the same procedure as outlined here.

Publishing Printers in Active Directory

If your print server is part of an Active Directory Domain Services (AD DS) domain, you can publish the printer to facilitate the task of users locating printers installed on the server. In the Print Management snap-in, right-click your printer

and choose **List in Directory**, as shown in Figure 13-8. You can also publish your printer when configuring sharing (or from Control Panel if you have not installed the Print and Document Services server role), by selecting the **List in the Directory** check box, which was previously shown in Figure 13-7.

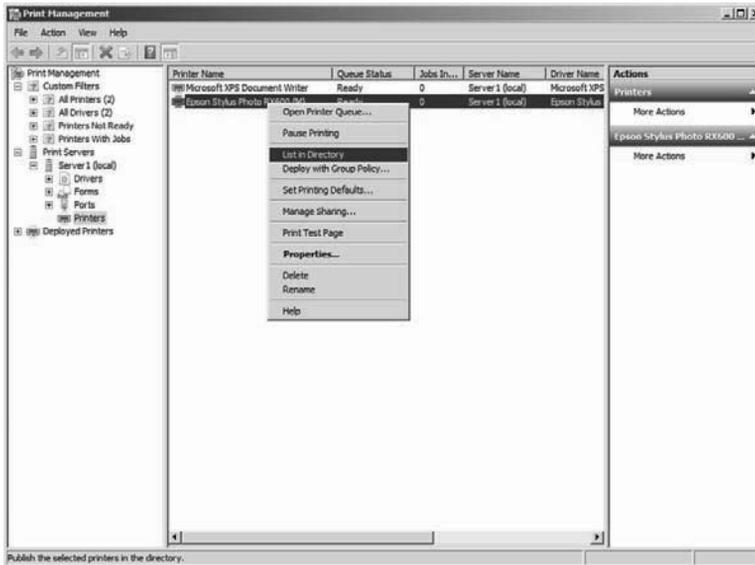

Figure 13-8 Publishing a printer in Active Directory.

If you want to remove your printer from AD DS, right-click it and choose **Remove from Directory** or clear the **List in the Directory** check box.

You can also use the `pubprn.vbs` script to publish a printer in AD DS from the command line. The syntax is as follows:

```
Cscript Pubprn.vbs {<ServerName> | <UNCPrinterPath>}
"LDAP://CN=<Container>,DC=<Container>"
```

In this command, `<ServerName>` specifies the name of the server hosting the printer to be published. If omitted, the local server is assumed. `<UNCPrinterPath>` represents the UNC path to the shared printer being published. `"LDAP://CN=<Container>,DC=<Container>"` specifies the path to the AD DS container where the printer is to be published.

For example, to publish a printer named `HPLaserJ` located at `Server1` to the `Printers` container in the `que.com` domain, use the following command at `Server1`:

```
Cscript Pubprn.vbs \\Server1\HPLaserJ LDAP://
CN=Printers,DC=Que,DC=com"
```

Using Group Policy to Deploy Printer Connections

Group Policy enables you to deploy printers in an AD DS domain environment, automatically making printer connections available to users and computers in the domain or organizational unit (OU). Use the following procedure to add printer connections to a Group Policy object (GPO):

1. In the details pane of the Print Management snap-in, right-click the desired printer and choose **Deploy with Group Policy**. (This option is visible in Figure 13-8, which was previously shown.)
2. The Deploy with Group Policy dialog box shown in Figure 13-9 opens. Click **Browse** and locate an appropriate GPO. If necessary, you can also create a new GPO for storing the printer connections.

Key Topic

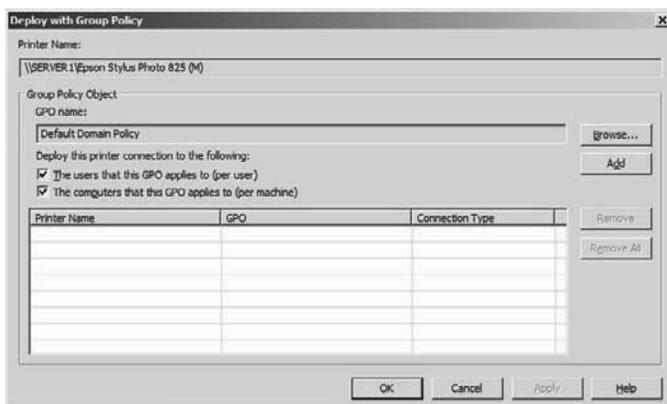

Figure 13-9 Using Group Policy to deploy printer connections.

3. Select either or both of the following options for deploying printer connections to users or computers, as required:
 - Select **The users that this GPO applies to (per user)** to deploy to groups of users, enabling these users to access the printer from any computer to which they log on.
 - Select **The computers that this GPO applies to (per machine)** to deploy to groups of computers, enabling all users of the computers to access your printer.
4. Click **Add**.
5. Repeat Steps 2 to 4 to deploy the printer connection settings to another GPO, if required.
6. Click **OK**.

Managing and Troubleshooting Printers

Several factors must be considered in administering printers. Like any other shared resource, they can be assigned permissions and their use can be audited. Also, special printing configurations, such as printer pools, can be set up. Multiple printers can be configured for one print device to handle different types of jobs. Furthermore, lots of things can go wrong with print jobs. Complaints from users that they cannot print or are denied access can make up a significant portion of a network administrator or support specialist's job.

NOTE For detailed information on printer management including sample procedures, refer to “Print Management Step-by-Step Guide” at [http://technet.microsoft.com/en-us/library/cc753109\(WS.10\).aspx](http://technet.microsoft.com/en-us/library/cc753109(WS.10).aspx).

Using the Printer Properties Dialog box

Each printer has a Properties dialog box associated with it that enables you to perform a large quantity of management tasks. You already saw how to share a printer or publish it in AD DS. This section discusses several additional tasks that you can perform from this dialog box. Right-click the printer in the details pane of the Print Management snap-in and choose **Properties**, or right-click the printer in the Control Panel Devices and Printers applet and choose **Printer Properties** to bring up this dialog box. In addition to the tabs discussed here, some printers show additional tabs; for example, color printers possess a Color Management tab that enables you to adjust color profile settings. Some printers possess a Version Information tab, which merely displays version information and contains no configurable settings.

General Tab

Use the General tab to rename the printer or modify the Location and Comment fields you supplied when installing the printer. You can also print a test page or modify printer preferences from this tab; click **Preferences** to open a dialog box that enables you to adjust settings, such as print quality, paper source, type, and size, maintenance factors such as print head cleaning, and so on. Appearance of, and options included in, this dialog box vary according to print device make and model.

Ports Tab and Printer Pooling

As shown in Figure 13-10, the Ports tab enables you to select various available ports to which a document will be printed. Documents will print to the first available

selected port. Click **Add Port** to bring up a dialog box that displays available port types and enables you to add new ports. From here, you can add a new TCP/IP port for accessing a network printer; a wizard is provided to guide you through the required steps. Options for configuring port options and deleting unneeded ports are also available.

Figure 13-10 The Ports tab of the printer's Properties dialog box enables you to configure printer ports and printer pooling.

The Ports tab also enables you to configure *printer pooling*. A printer pool is a group of print devices that are connected to a single printer through multiple ports on the print server. These print devices should be the same make and model so that they use the same printer driver. This method is useful because it allows pooling of similar print devices. In high volume print situations, if one print device is busy, print jobs directed to a printer can be spooled to another available print device that is part of the printer pool and printing jobs are completed more quickly. To configure printer pooling, specify a different port for each print device in the printer pool. Then, select the check box labeled **Enable printer pooling** and click **OK**.

To client computers, the printer pool appears as though it were a single printer. When users submit print jobs to the printer pool, the jobs are printed on any available print device. You should position the physical print devices in close proximity to each other so that the user does not have to search for print jobs. Enabling separator pages is a best practice that you should follow so that the users can locate their print jobs rapidly and conveniently.

This tab also enables you to redirect a printer should a problem occur with its print device and you need to take it offline for maintenance. Redirecting a printer on the print server redirects all documents sent to that printer. However, you cannot redirect individual documents. To do so, click **Add Port**, and on the Printer Ports dialog box, select **Local Port**, and then click **New Port**. In the Port Name dialog box that appears, enter the UNC or URL path to the other printer, and then click **OK**.

TIP Configuration changes to the available ports on any print server affect all printers set up on that server. Also note that it is a good idea to locate all the print devices that make up a printer pool in the same general area of your operation. People won't need to roam the halls of your organization in search of printed out jobs.

Advanced Tab

The Advanced tab enables you to control the availability of the printer and configure drivers and spool settings. Available settings on this tab are shown in Figure 13-11 and described in Table 13-3.

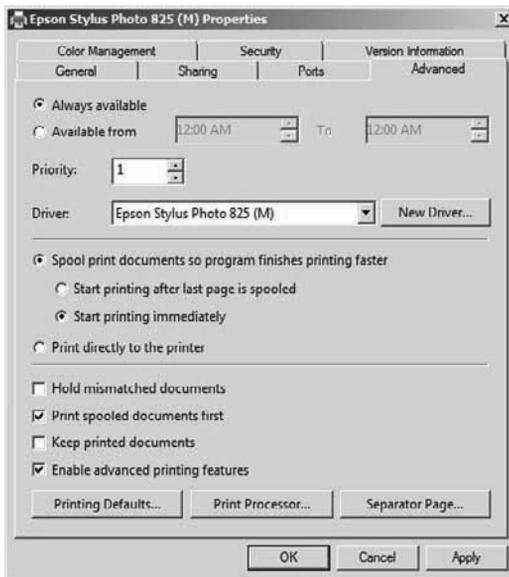

Figure 13-11 The Advanced tab of the printer's Properties dialog box enables you to control availability, priority, and spooler settings.

**Key
Topic**
Table 13-3 Configurable Advanced Printer Properties

Setting	Description
Always available and available from	Enables you to specify the hours of the day when the printer is available. For example, you can configure a printer that accepts large jobs to print only between 6 p.m. and 8 a.m. so that shorter jobs can be printed rapidly. Jobs submitted outside the available hours are kept in the print queue until the available time.
Priority	Enables you to assign a numerical priority to the printer. This priority ranges from 1 to 99, with higher numbers receiving higher priority. The default priority is 1. For example, you can assign a printer for managers with a priority of 99 so that their print jobs are completed before those of other employees.
Spool print documents so program finishes printing faster	Enables spooling of print documents. Select from the following: <ul style="list-style-type: none"> ■ Start printing after last page is spooled: Prevents documents from printing until completely spooled. Prevents delays when the print device prints pages faster than the rate at which they are provided. ■ Start printing immediately: The default option causes documents to be printed as rapidly as possible.
Print directly to the printer	Sends documents to the print device without first writing them to the print server's hard disk drive. Recommended only for non-shared printers.
Hold mismatched documents	The spooler holds documents that do not match the available form until this form is loaded. Other documents that match the form can print.
Print spooled documents first	Documents are printed in the order that they finish spooling, rather than in the order that they start spooling. Use this option if you selected the Start printing immediately option.
Keep printed documents	Retains printed jobs in the print spooler. Enables a user to resubmit a document from the print queue rather than from an application.
Enable advanced printing features	Turns on metafile spooling and presents additional options like page order and pages per sheet. This is selected by default and should be turned off only if printer compatibility problems arise.
Printing Defaults command button	Selects the default orientation and order of pages being printed. Users can modify this from most applications if desired. Additional print device-specific settings may be present.
Print Processor command button	Specifies the available print processor, which processes a document into the appropriate print job. Available print processors are described in "Print Processor" at http://technet.microsoft.com/en-us/library/cc976744.aspx .

Setting	Description
Separator Page command button	Enables you to specify a separator page file, which is printed at the start of a print job to identify the print job and the user who submitted it. This is useful for identifying printed output when many users access a single print device.

TIP Unreadable output indicates incorrect printer drivers. If the printer produces a series of unintelligible characters rather than the expected output, the problem lies in the printer driver. Check with the manufacturer of the print device and ensure that you have installed the correct printer drivers.

TIP You can configure different printers associated with the same print device so that managers' print jobs are printed before those of other users or so that long print jobs wait until after hours to prevent tying up a print device for an extended period of time. To do this, simply assign a priority of 99 to the managers' printer and 1 to the printer used by all other users. Also, assign permissions so that only the managers can print to their printer.

Security Tab and Printer Permissions

Just as you can assign permissions to files and folders as you learned in Chapter 9, you can assign permissions to printers. Printers have access control lists (ACL) that you can modify in the same manner. Use the following steps to configure a printer's permissions from the Security tab of its Properties dialog box:

1. Select the **Security** tab of the printer's Properties dialog box, as shown in Figure 13-12.

Figure 13-12 The Security tab of the printer's Properties dialog box enables you to configure printer permissions.

2. If you need to add users or groups to the ACL, click **Add** to open the Select Users, Computers, or Groups dialog box.
3. In this dialog box, click **Advanced**, and then click **Find now** to locate the required users or groups. You may also use the fields in the Common Queries area of the dialog box to narrow the search for the appropriate object.
4. Select one or more users or groups in the list, and then click **OK**. This returns you to the Security tab of the printer's Properties dialog box.
5. Select the permissions you want to allow or deny from the available list. Table 13-4 describes the available permissions.
6. If you need to assign special permissions or check the effective permissions granted to a specific user, click **Advanced**. The options available are similar to those discussed in Chapter 9 for files and folders.
7. When you finish, click **OK** or **Apply** to apply your settings.

Table 13-4 Windows Server 2008 Printer Permissions

Permission	Description
Print	Enables users to connect to the printer to print documents and control settings for their own documents only. Users can pause, delete, and restart their own jobs only.
Manage this printer	Enables users to assign forms to paper trays and set a separator page. Users can also pause, resume, and purge the printer, change printer properties and permissions, and even delete the printer itself. Also enables users to perform the tasks associated with the Manage Documents permission.
Manage documents	Enables users to pause, resume, restart, and delete all documents. Users can also set the notification level for completed print jobs and set priority and scheduling properties for documents to be printed.
Special permissions	Similar to NTFS security permissions discussed in Chapter 9, the three default printer permissions are made up of granular permissions. Click Advanced to bring up the Advanced Security Settings dialog box, from which you can configure these permissions, if required.

NOTE The act of managing print jobs includes the two actions of resuming and restarting print jobs. Resuming a print job means to restart the job from the point at which it was paused, for example to add more paper to the printer. Restarting a print job means to restart it from the beginning, for example when the print job is being printed on the wrong type of paper. You can perform either of these tasks by right-clicking the print job in the print queue and selecting the appropriate option.

TIP Print permissions behave in much the same fashion as file and folder permissions. As with file and folder permissions, printer permissions are cumulative, with the user receiving the sum of all permissions granted to any groups to which he belongs. If you explicitly deny a permission to a user or group by selecting a check box in the **Deny** column, this denial overrides any other allowed permissions the user might have, in exactly the same manner as discussed in Chapter 9 for file and folder permissions.

Migrating Print Queues and Printer Settings

The Print Management snap-in enables you to export print queues, printer settings, printer ports, and language monitors, and then import these settings to another print server. Doing so enables you to consolidate multiple print servers or replace an older server.

Use the following procedure to perform a print migration:

1. In the console tree of the Print Management snap-in, expand the Print servers node, right-click the print server whose queues you want to export, and select **Export printers to a file**. The Printer Migration Wizard starts.
2. On the Review the list of items to be exported page, verify the objects listed that will be exported and click **Next**.
3. On the Select the file location page, type the path to the required file or click **Browse** to locate an appropriate file. The file you specified will be saved with a `.printerExport` extension.
4. The Exporting page tracks the progress of the export, and then displays an `Export complete` message. This page also informs you of any errors that might have occurred. You can obtain information on any errors from Event Viewer by clicking the **Open Event Viewer** command button provided on this page. This button opens Event Viewer to a Printer Migration Events subnode that displays events related to the migration process. For more information, refer to Chapter 20, “Configuring Event Logs.” When done, click **Finish**.

Use the following steps to import the print queue to the new server:

1. In the console tree of the Print Management snap-in, expand the Print servers node, right-click the print server whose queues you want to import, and select **Import printers from a file**. The Printer Migration Wizard starts.
2. On the Select the file location page, type or browse to the location of the `.printerExport` file to be imported.
3. On the Review the list of items to be imported page, review the list of objects that will be imported, and then click **Next**.
4. On the Select import options page, select the following import options:
 - **Import mode:** Select **Keep existing printers** to maintain the settings on any existing printers that are installed on this print server, or select **Overwrite existing printers** to restore printer information from the backup file and overwrite the settings for existing printers on this print server.

- **List in the directory:** Select **List printers that previously existed** to maintain the current listing of printers in AD DS; select **List all printers** to add newly imported printers to the listing in AD DS; or select **Don't list any printers** to clear the listing of printers in AD DS.
 - Select the **Convert LPR Ports to Standard Port Monitors** check box to convert Line Printer Remote (LPR) printer ports to the faster Standard Port Monitor when performing the import operation.
5. Click **Next**.
 6. The Importing page tracks the progress of the import operation and displays an `Import Complete` operation when finished. This page also informs you of any errors that might have occurred. You can obtain information on any errors from Event Viewer by clicking **Open Event Viewer**, as previously described for the export action. When done, click **Finish**.

NOTE You can also migrate printer queues and settings from the command line by using the `Printbrm.exe` command. For more information on exporting and importing print queues and settings, refer to “Migrate Print Servers” at <http://technet.microsoft.com/en-us/library/cc722360.aspx>.

Isolating Printer Drivers

Windows Server 2008 R2 introduces the capability to configure printer driver components to run in a process that is isolated from other processes including the spooler process. Doing so improves the reliability of the Windows print service by preventing a faulty printer driver from stopping all print operations on the print server. In previous Windows Server versions, including the original version of Windows Server 2008, printer drivers ran in the same process as the spooler; if a driver component were to fail, all print operations from the server would be halted.

Driver isolation is specified by an INF file that installs the printer driver. If this file indicates that the driver being installed supports driver isolation, the installer automatically configures the driver to run in an isolated process. This is specified by a `DriverIsolation` keyword in the INF file. If this variable is set to 2, the driver supports driver isolation; if it is omitted or set to 0, the driver does not support driver isolation.

To configure driver isolation, select the **Drivers** subnode under the print server in the Print Management snap-in. Right-click the driver and choose **Set Driver Isolation**

> **Isolated**, as shown in Figure 13-13. To disable driver isolation, choose **None** or **Shared**.

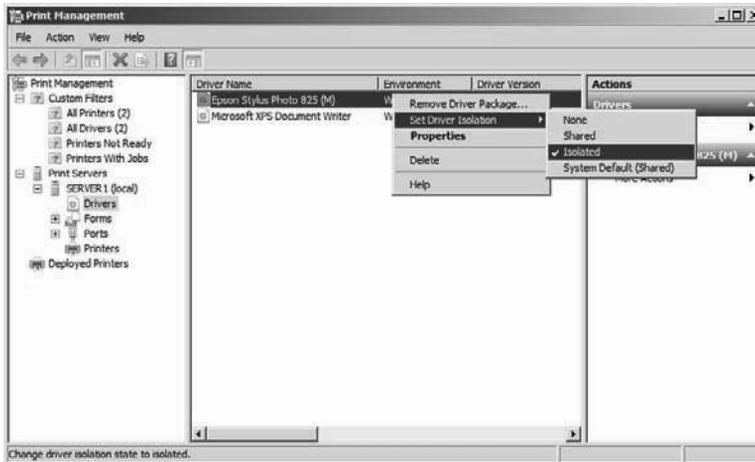

Figure 13-13 Configuring printer driver isolation.

NOTE For more information on printer driver isolation, refer to “Printer Driver Isolation” at [http://msdn.microsoft.com/en-us/library/ff560836\(VS.85\).aspx](http://msdn.microsoft.com/en-us/library/ff560836(VS.85).aspx).

TIP Sometimes, you might have a server on which you’ve installed different types of printers, such as laser, color laser, or color inkjet. Enabling printer driver isolation enables you to ensure that should a driver problem be encountered with one printer type, users can continue to use other printers of a different type on the same server.

Configuring Location-Aware Printer Settings

Windows Server 2008 R2 introduces a location-aware default printer settings. Users with mobile computers running Windows 7 Professional, Enterprise, or Ultimate can configure a different default printer according to the network to which they are connected. For example, a user can specify a default printer when in the office, and a different default printer set for home. The laptop automatically selects the correct default printer according to the current location of the user.

Use the following procedure on a Windows 7 computer to configure location-aware printing:

1. Click **Start > Devices and Printers**. The Control Panel Devices and Printers applet opens.
2. Select a printer from those displayed under Printers and Faxes, and then click the **Manage Default Printers** option on the menu bar.
3. From the Manage Default Printers dialog box that appears, select the **Change my default printer when I change networks** radio button.
4. Select a printer for each network to which you connect, click **Add**, and then click **OK** when finished.

Delegating Print Management

New to Windows Server 2008 R2 and Windows 7 is the ability to delegate print-management tasks directly to users who are not members of a group with built-in print-management capabilities, such as the Administrators, Server Operators, or Print Operators groups. This capability enables you to balance administrative workloads across users without the need to grant excessive administrative capabilities; it also enables you to configure default printer security settings on print servers so that new printers inherit these settings automatically as you install them.

The Security tab of the print server's Properties dialog box introduces the following new permissions, which enable you to delegate print management tasks:

- **View Server:** Enables users to view the print server, including the printers that are managed by the server. By default, the Everyone group is granted this permission.
- **Manage Server:** Enables users to create and delete print queues with already installed drivers, add or delete ports, and add or delete forms. By default, administrators and the Interactive group are granted this permission. A user who has been granted this permission is referred to as a “delegated print administrator.”

You need to be a member of the Administrators group or running with administrative privileges to create a delegated print administrator. Use the following procedure:

1. In the console tree of the Print Management snap-in, right-click the print server and choose **Properties**.

2. Select the **Security** tab to display the default permissions, as shown in Figure 13-14.

Figure 13-14 The Security tab of the print server's Properties dialog box enables you to delegate administrative control of printers attached to the server.

3. Click **Add** to add the user or group to which you want to delegate users, type the required user or group name, and then click **OK**. The user or group is added to the list in the Security tab.
4. Select this user or group and then select the check box under the **Allow** column for **Manage Server**. (This also selects the **View Server** permission.)
5. Also, select the **Print**, **Manage Documents**, and **Manage Printers** permissions in the Allow column.
6. To delegate just the ability to add printers, follow Step 3 to add the user or group, and then select the **Manage Server** and **Print** permissions only. (This also selects the **View Server** permission.)
7. To delegate just the ability to manage existing print queues, follow Step 3, and then select the **View Server**, **Print**, **Manage Documents**, and **Manage Printer** permissions.
8. When finished, click **OK** to apply the permissions and close the Security tab of the Print Server Properties dialog box.

NOTE For more information on delegating administrative control of printers, refer to “Assigning Delegated Print Administrator and Printer Permission Settings in Windows Server 2008 R2” at [http://technet.microsoft.com/en-us/library/ee524015\(W.S.10\).aspx](http://technet.microsoft.com/en-us/library/ee524015(W.S.10).aspx). Included in this reference are tables that describe the tasks that users granted the various permissions in the print server’s Security tab are entitled to perform.

Troubleshooting Printer Problems

Lots of things can go wrong in a print job’s journey from an application to a print device, with stops in between at the operating system and its print drivers. By having reviewed the printing process described at the beginning of this chapter, you can often locate the source of printing problems.

Some Common Problems

When a user complains that he cannot print, the first thing to do is check the physical aspects of the print device, such as the cable, power, and paper. If you need to check more advanced print device-related problems, refer to *CompTIA A+ Cert Guide, 220-701 and 220-702* (by Mark Edward Soper, Scott Mueller, and David L. Prowse) for more suggestions.

`Access Denied` errors usually indicate that printer permissions are not configured correctly or that they are not configured to the user’s liking.

If the printed document comes out garbled, someone has installed an incorrect print driver. You should ensure that the correct driver for the problematic client is installed. (Click **Additional Drivers** on the Sharing tab of the printer’s Properties dialog box to add a driver.) Occasionally, this problem can result from a resource conflict with the parallel port or a damaged printer cable. Check the printer cable for damage; also check for conflicts using Device Manager.

Occasionally, print jobs get stuck in the spooler. You might notice that no print jobs are coming out and the hard drive on the print server appears to be thrashing. If this should happen, you need to stop and restart the spooler service. Use the following procedure:

1. In the console tree of Server Manager, expand the **Configuration** node and select **Services**. This displays the list of services in the details pane.
2. Right-click **Print Spooler** and choose **Stop**.

3. Right-click it again and choose **Start**. This clears the jammed print job from the queue and allows other print jobs to print.

You can modify spool settings on a per-printer basis, making the printing process more efficient. The Advanced tab of the printer's Properties dialog box contains several settings previously shown in Figure 13-11 and described in Table 13-3 that you can modify to optimize the spool process if necessary.

Printer Port Problems

Improperly configured printer ports can cause printing failures. Errors can occur if a user configures a computer to print directly to the printer or to use bidirectional printing when the print device does not support these functions.

TCP/IP printing, like the protocol itself, is subject to connectivity problems that require a good grounding in the TCP/IP protocol, as provided in Chapter 1, "Configuring IPv4 and IPv6 Addressing." If TCP/IP port problems occur, try configuring the standard TCP/IP port monitor for your printer. You may need to reconfigure the standard port monitor port from the printer's Properties dialog box. On the Ports tab of this dialog box (previously shown in Figure 13-10), click **Configure Port**. You may need to check with the manufacturer of the print device to see if it supports Simple Network Management Protocol (SNMP). Printers use SNMP to return print status. On print devices that support SNMP, printer status is returned to the user, including errors that occur during printing. If a print device does not support SNMP, you will either receive a generic printing error message or no error message when a printing error occurs.

You may need to add an additional TCP/IP port using the procedure described earlier in this chapter. You may also need to verify the port name and the printer name or IP address in the Ports tab of the printer's Properties dialog box. To do so, click **Configure Port**, and make the required modifications in the Configure Standard TCP/IP Port Monitor dialog box that appears. Then, click **OK** and click **Close** to close the printer's Properties dialog box.

Enabling Notifications

The Print Management snap-in enables you to set up filters that can respond to printers encountering problem conditions such as paper jams or running out of paper. Such a filter can perform an action such as sending an e-mail to an administrator, running a script, or so on.

Use the following procedure to set up a filter for notification purposes:

1. In the console tree of the Print Management snap-in, right-click **Custom Filters** and choose **Add New Printer Filter**. This starts the New Printer Filter Wizard.
2. On the Printer Filter Name and Description page, type a name and optional description, and then click **Next**.
3. On the Define a filter page shown in Figure 13-15, specify values for the filter criteria, as follows:
 - **Field:** Specify a characteristic for the print server, queue, or status. By specifying **Queue Status**, you can evaluate a printer's current status.
 - **Condition:** Specify a Boolean characteristic, such as "is exactly," "begins with," "contains," or several others. Available conditions depend on the Field value.
 - **Value:** The value to be matched for the criteria to be met.

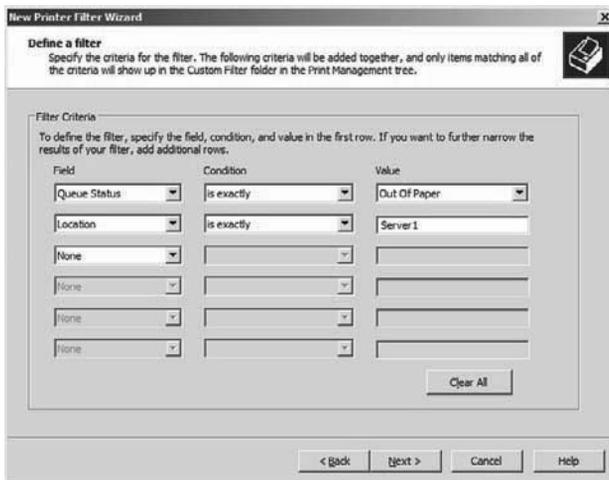

Figure 13-15 Defining a filter that alerts you to an out of paper condition on any printer attached to a server named Server1.

4. When finished specifying the appropriate criteria, click **Next** to display the Set Notifications (Optional) page.
5. On this page, select **Send e-mail notification** and type one or more e-mail addresses of individuals to be notified in the format `account@domain`. Also type the e-mail address of the sender, the name or IP address of the SMTP server that will relay the message, and message text to be included in the e-mail. If you want to run a script, select **Run script** and type the path to the required script or click **Browse** to locate the script. Use the Additional arguments field to include any required script parameters.
6. When done, click **Finish**.

Exam Preparation Tasks

Review All the Key Topics

Key Topic

Review the most important topics in this chapter, noted with the key topics icon in the outer margin of the page. Table 13-5 lists a reference of these key topics and the page numbers on which each is found.

Table 13-5 Key Topics for Chapter 13

Key Topic Element	Description	Page Number
Table 13-2	Describes important terms that you might otherwise confuse with regard to printing.	537
List	Shows you how to install the Print and Document Services server role.	540
List	Shows you how to install a printer from Control Panel.	542
List	Shows you how to install a printer from the Print Management snap-in.	544
Figure 13-7	Sharing a printer.	546
Figure 13-9	Deploying a printer connection using Group Policy.	548
Table 13-3	Describes configurable advanced printer properties.	552
Table 13-4	Describes printer permissions.	555
Paragraph	Describes printer driver isolation.	557
List	Shows you how to delegate print management tasks.	559

Complete the Tables and Lists from Memory

Print a copy of Appendix B, “Memory Tables,” (found on the CD), or at least the section for this chapter, and complete the tables and lists from memory. Appendix C, “Memory Tables Answer Key,” also on the CD, includes the completed tables and lists to check your work.

Definition of Key Terms

Define the following key terms from this chapter, and check your answers in the Glossary.

local printer, location-aware printing, network printer, print device, print driver, print driver isolation, print pooling, print queue, print server, print spooler, printer, printer pool, printer priority

Numerics

6to4 addresses, 64-65

128-bit addressing. *See* IPv6 addressing

802.1X, 622, 676-678

802.3 standard, 623, 630-632

A

access policies

configuring

for 802.3 networks, 630-632

for wireless networks, 623-628

access-based enumeration, enabling for DFS namespaces, 443-444

accounting, configuring RADIUS, 644-647

activating Pearson IT Certification Practice Test engine, 9

active study strategies, 7

AD (Active Directory)

DHCP servers, authorizing, 116-117

DNS replication, 274-277

application directory partition, 274-275

replication scope, 275-277

printer connections, deploying, 548

printers, publishing, 546-547

adding

connections to replication groups, 450-451

folders to DFS namespaces, 440-441

members to replication groups, 451

servers to DFS namespaces, 441-443

address classes

IPv4, 41

IPv4 addresses, 41

IPv6 addressing, 58

AD-integrated zones, 250

administrative event logs, 804

advanced NTFS permissions, applying, 373-375

Advanced tab, configuring DNS server properties, 228-231

Advanced tab (Printer Properties dialog box), 551-552

AES (Advanced Encryption Standard), 193

alias resource records, creating, 302

analytic event logs, 804

anycast IPv6 addresses, 57

Application and Services Logs node (Event Viewer), 804-805

application directory partition, 274-275

application layer, 34

application layer (TCP/IP model), 36, 40-41

- applying NTFS permissions, 371-373
- approving updates (WSUS), 742-744
- ARP (Address Resolution Protocol), 39, 70
- ARPANET, 33
- ATMA resource records, 305
- auditing DNS replication, 283-287
- authentication
 - Connection Security Rules subnode (Windows Firewall with Advanced Security), configuring, 848-849
 - DirectAccess, configuring, 708
 - EAP, 621-622
 - remote access authentication protocols, 574-575
 - VPNs, 591-592
 - for wireless networking, planning, 621-622
- authorizing DHCP servers in AD, 116-117
- autoconfiguration flags (DHCP) v6, 94

B

backing up data

- bare metal backups, performing, 472
- EFS keys, 389-391
- file servers, 467-472
- to removable media, 472
- with VSS, 477-482
- with wbadm command, 474-475
- Windows Server Backup, backup permissions, 466

backup catalog, restoring, 475-476

backups

- managing remotely, 476-477
- scheduling, 472-474

- bare metal backups, performing, 472

- bare metal recoveries, performing, 488-491

benefits

- of DirectAccess, 698
- of IPv6 addressing, 55-56

best practices

- for EFS management, 385-386
- for file sharing, 383-384
- for quotas, 522-523

BitLocker, 395-408

- data recovery agents, 405-408
- enabling, 397-402
- fixed data drive policies, 404-405
- group policies, configuring, 403
- managing, 402
- operating system drives, 403
- preparing computer for, 397
- TPM, 395

BITS (Background Intelligent Transfer Service), 414

bitwise logical AND operation, 45

BranchCache

- configuring, 414-419
 - with *Group Policy*, 417-418
 - with *netsh command*, 415-416
- deploying across VPNs, 419-420
- firewall rules, specifying, 417-418

broadcasts (NetBIOS), 337

C

cache locking, 239-240

caching-only servers, 255

candidates for MCITP/MCTS certification, 12

canonical names, 302

- capturing network data, 837-839
- certification (MCITP/MCTS),
 - candidates for, 12
- CHAP (Challenge Handshake Authentication Protocol), 576
- CIDR (Classless Interdomain Routing), 47
- client computers, configuring WSUS, 748-753
- client interface (Connection Manager), 610-611
- client requirements, DirectAccess, 702-703
- client-side targeting, configuring (WSUS), 741-742
- CMAK (Connection Manager Administration Kit), 604-610
- collecting real-time data with Performance Monitor, 764-766
- collector initiated Event Subscriptions, configuring, 810-811
- command line
 - DHCP
 - installing*, 100
 - scopes, creating*, 104-105
 - DNS, installing on Windows Server 2008 R2, 221
 - IPv4 addressing, configuring, 52-54
 - network data, capturing, 845-846
 - performance monitoring commands, 779
 - resource records, creating, 307
 - shadow copies, managing, 480
- common-sense strategies
- communities, SNMP, 826-828
- component protocols (TCP/IP)
 - ARP, 39
 - ICMP, 39-40
 - IGMP, 40
 - IP, 39
 - TCP, 38
 - UDP, 38-39
- components
 - of DirectAccess, 699
 - of routing tables, 137
- computer groups, 738-740
- configuring
 - BitLocker, group policies, 403
 - BranchCache, 414-419
 - with Group Policy*, 417-418
 - with netsh command*, 415-416
 - Connection Security Rules subnode, authentication, 848-849
 - DFS, domain controller polling, 444-445
 - DFS Replication, 447-448, 452-454
 - DHCP
 - relay agents*, 117-120
 - scope options*, 108-116
 - scope properties*, 107
 - DirectAccess
 - authentication*, 708
 - clients*, 708-709
 - DirectAccess server feature, 703-706
 - DNS
 - Advanced tab*, 228-231
 - cache locking*, 239-240
 - Debug Logging tab*, 233-234
 - DnsUpdateProxy groups*, 314-315
 - Event Logging tab*, 235
 - Forwarders tab*, 224-228
 - Interfaces tab*, 223-224
 - Monitoring tab*, 237-238
 - Root Hints tab*, 231-233
 - socket pooling*, 238-239

- Trust Anchors tab, 235-237*
- zone transfers, 279-280*
- DNS Notify, 281
- event logs, 806-807
 - Event Subscriptions, 809-814*
 - subscriptions, 811-814*
- Event Subscriptions
 - collector initiated, 810-811*
 - source initiated, 810*
- events, tasks, 814-816
- file sharing, 360-369
- IPv4 addressing, 48-52
- IPv6 addressing, 59-61
- NAP
 - policies, 684-688*
 - WSHV, 681-684*
- NAT, 588-590
- NAT server for DHCP, 586-587
- NPS
 - templates, 647-648*
 - for wireless access, 635-638*
- NTFS permissions, inheritance, 375-377
- Offline Files feature, 409-411
 - client computers, 411*
 - transparent caching, 413*
- printers, location-aware settings, 558-559
- RADIUS accounting, 644-647
- resource records
 - Name Server resource records, 311-314*
 - security, 317-318*
 - SOA resource records, 309-311*
- round robin, 316
- RRAS, 140-141
 - demand-dial routing, 148-151*
 - for dial-up connections, 577-581*
- IGMP proxy, 153-155*
- packet filtering, 151-153*
- RIP, 142-144*
- static routing, 145-147*
- secure zone transfers, 282-283
- shared folder properties, 363-367
- SNMP, 829-833
- VPNs
 - packet filtering, 601-603*
 - on RRAS, 592-594*
 - security, 595-598*
- Windows Firewall, 165-172
- Windows Firewall with Advanced Security
 - connection security rules, 180-184*
 - inbound/outbound rules, 176-180*
 - multiple firewall profiles, 174-176*
 - notifications, 189*
 - rule properties, 184-189*
- wireless networking, access policies, 623-628
- WSUS, 733-737
 - client computers, 748-753*
 - client-side targeting, 741-742*
 - server-side targeting, 740*
- zones properties, 263-270
- Connection Manager, 603-611**
- connection request policies**
 - configuring, 180-184
 - creating, 641-644
- Connection Security Rules subnode (Windows Firewall with Advanced Security), 847-848**
 - authentication, configuring, 848-849
- connections, adding to replication groups, 450-451**

copying files and folders with NTFS permissions, 381-382**creating**

- connection request policies, 641-644
- delegated subdomains, 272-274
- DHCP scopes, 101-104
- file screens, 503-505
- IPsec policies with Group Policy, 194-198
- namespaces, 438-439
- proxy groups, 639-640
- quota templates, 520-522
- resource records
 - alias resource records, 302*
 - with command line, 307*
 - host resource records, 301*
 - mail exchange resource records, 303*
- VPN connections, 594-596
- zones
 - GlobalNames zones, 262-263*
 - reverse lookup zones, 259-261*
 - secondary zones, 261-262*

Tunnel mode (IPsec), 191

U

UDP (User Datagram Protocol), 38-39

UNC (universal naming convention) path, 433

unicast IPv6 addresses, 56-57

unique local IPv6 unicast addresses, 58

updates (WSUS)

- approving, 742-744

- declining, 744

- testing, 738-742

updating with WSUS, 724-727
 user profiles, restoring with Windows Server Backup, 486
 user-defined Data Collector Sets, 771-777

V

viewing

effective permissions, 380-381
 logs in Event Viewer, 800-802
 WSUS reports, 745-747

volume quotas, managing with FSRM, 516-523

VPNs (virtual private networks), 590

audit policies, 599-600
 authentication, 591-592
 configuring on RRAS, 592-594
 connections, creating, 594-596
 data encryption, 592
 deploying BranchCache on, 419-420
 encapsulation, 591
 NAP enforcement, 668-670
 packet filters, configuring, 601-603
 Reconnect feature, enabling, 598-599
 remote access policies, 601
 security, configuring, 595-598

VSS (Volume Shadow Copy Service), 477-482

shadow copies

folders, recovering, 480-482
managing with command line, 480
managing with Windows Explorer, 478-479

W

wbadmin command

data backups, performing, 474-475
 full server recoveries, performing, 491-492

WEP (Wired Equivalent Privacy), 622

Windows Explorer, managing shadow copies, 478-479

Windows Firewall, configuring. *See also* Windows Firewall with Advanced Security

Windows Firewall with Advanced Security, 172-191, 848-849

connection security rules, configuring, 180-184

Connection Security Rules subnode, 847-848

inbound/outbound rules, configuring, 176-180

multiple firewall profiles, configuring, 174-176

notifications, configuring, 189

policies, creating with Group Policy, 198-199

policies, importing/exporting, 190-191

rule properties, configuring, 184-189

Windows Search Service, 359

Windows Server 2008

connectivity, troubleshooting, 68-70

DFS

improvements to, 434-435

installing, 435-437

DHCP server installation, 96-100

DNS, installing, 218-222

File Services, installing, 359-360

NPS, installing, 634-635
